I. Background and Scientific Objectives (excerpts from the Science Support Plan)

Cruise Overview

MGL19-02 is an active seismic survey using both ocean bottom seismometers and multichannel streamer from the *R/V Langseth*, in the Central Pacific. The proposed survey would occur within ~43–48°N, ~165–174°E (Figure 1.1) The principal investigators (PIs) and science party objectives will drive this program on the *Langseth* with the coordination and advisement of the technical staff headed by the Office of Marine Operations (OMO) at Lamont Doherty Earth Observatory (LDEO).

The procedures to be used for the proposed marine geophysical surveys would be similar to those used during previous surveys by L-DEO and would use conventional seismic methodology. The surveys would involve one source vessel, the *Langseth*. The *Langseth* would deploy an array of 36 Source Elements as an energy source with a total volume of ~6600 in³. The receiving system on each line would consist of 32 OBSs and a single hydrophone streamer 15 km in length towed by the *Langseth*. A longer streamer provides opportunities to suppress unwanted energy that interferes with imaging targets, allows for accurate measurements of seismic velocities, and provides a large amount of data redundancy for enhancing seismic images during data processing. As the source array is towed along the survey lines, the OBSs would receive and store the returning acoustic signals internally for later analysis, and the hydrophone streamer would transfer the data to the on-board processing system.

The *Langseth* will transit from Honolulu to the east end of the E-W dip profile and deploy 32 OBSs to the west on this profile. The guns will then be deployed, and we will acquire refraction data on this profile from west to east. The source will be recovered and all OBS will be recovered. The streamer and source array would then be deployed, and MCS data would be acquired on the E-W dip profile (from west to east), a connecting profile, and then on the N-S strike line (from north to south). The streamer and guns will be recovered and then OBS data will be deployed on the N-S line (from south to north). The air gun array will be deployed, and refraction data will be acquired from north to south on this line. The gun array will be retrieved, and OBS will be recovered from south to north. We will then steam back to port in Kodiak. Depending on the time required for transit, weather conditions, etc, we may consider a revision to the plan above that would involve recording MCS and OBS shots on the E-W profile.

Other supporting equipment shall consist of a Kongsberg EM122 Multibeam echo sounder, Knudsen 3260 3.5 kHz Sub-Bottom Profiler, Bell Aerospace BGM-3 gravimeter, the RDI 75 kHz Acoustic Doppler Current Profiler (ADCP), and the Geometrics 882 magnetometers. LDEO will ensure that the equipment in use meets the manufacturer's specifications, and also meets internal quality requirements. The technicians onboard are proficient in the operations of standard systems but are not experts. If the investigation requires expertise in any of the acquisition, including data processing, staff the science party accordingly (i.e. sail a data processor equipped with the proper equipment to complete the science objectives, including software). Other science studies will be ongoing, per scientist request and shipboard specifications.

In addition to the operations of the air-sound-source array, a Multi-beam echo sounder (MBES) and a Sub-Bottom Profiler (SBP) will also be operated from the *Langseth*. All planned geophysical data acquisition activities would be conducted by LDEO with on-board assistance by the scientists who have proposed the study. The vessel would be self-contained, and the crew would live aboard the vessel for the entire cruise.

The principal investigator (PI) is Dr. Donna Shillington (LDEO). She will be onboard for the survey operations, as well as two other PIs (Dunn and Watts) and 12 other scientists/students (science party total of 15 including WHOI and GEOMAR OBS teams), 5 LDEO technicians, 5 contract technicians and 5 Protected Species Observers (PSOs).

The cruise is expected to take 48 days to complete, of which 44 days are at sea; currently mobilization is scheduled to start on 12 April 2019 and completion of demobilization on 19 April, 2019. The ship is scheduled to sail on 19 April, 2019 from Honolulu, Hawaii. Scientists will be permitted onboard the vessel on 17 April 2019. Vessel is scheduled to arrive on 2 June 2019 in Kodiak, Alaska. At the end of the cruise, the scientists must disembark the day after the ship arrives in port.

Science Navigation Instrumentation

FE700 - Not in use on MGL1902

The FE700 was not in use on MGL1902.

EM-122 Multibeam

The EM122 multibeam sonar was operated throughout the cruise. The system is designed for deeper water, and does not track ground well in less than 50m of water.

EM122 swath data is saved to the cruise archive under MGL1902/raw/multibeam. Center beam depth is recorded separately to serial log. A daily built in self test (BIST) is done on the EM122 at which time logging of data is secured. Data gaps are approximately 8-12 minutes in duration, and every effort is made to schedule them during turns or areas where coverage already exists. See MGL1902/docs/elog for times and durations of tests.

Physical Configuration

The towing configuration for the air guns, streamers, antennas, and in-water offsets are detailed in the document titled *MGL1902_Offsets_MCS_Line.xls*.

Spectra

Spectra was used for all timing and navigation during the cruise. Spectra generated UKOOA P294 and P190 files for the MCS line(s) acquired.

Sprint

Sprint was used for post processing of Spectra UKOOA P294 files to produce UKOOA P190 files with improved positioning.
