

NBP9602 - SEISMIC RECORDING AND PROCESSING

Katrin Hafner - April 6, 1996

Recording

Approximately 1220 nautical miles of multichannel, and 900 nautical miles of single channel seismic reflection data were collected during late February and March of 1996 in the Ross, Amundsen and Bellingshausen Seas. Nine sonobuoys were launched, eight of which turned on. Seismic data was collected with a five gun array, shooting every 12 or 15 seconds at 5 to 6 knots, in water depths ranging from 3400 to 4600 meters. Sea and ice conditions varied. In general, the "single channel system" was used in areas where ice was expected. The "single channel" streamer was actually a modification of the full 1.2 km 48 channel streamer. In the single channel configuration, the last 16 channels of the multichannel streamer were towed, and arrivals at the last 12 channels were recorded. The streamer needed to be weighted down in this configuration, making it difficult to quickly alternate between the single channel and multichannel configuration. In the beginning the arrivals on the 12 channels were summed in groups of four and recorded onto three channels, while later in the cruise all 12 channels were recorded separately.

All multichannel and single channel data were recorded in SEG-D 8048 format on a OYO DAS-1 digital recorder running software version 1.26B. Data were recorded with a 2 or 3 second deep water delay, record lengths of 8.192 or 6.144 seconds, and a sample rate of 0.002 seconds. In general the recording system worked well. The few problems we did encounter included the fact that the OYO system does not update dates and times correctly when it is not in recording mode, resulting in the wrong time stamp being recorded in some file headers. The second, and more serious problem was the writing of corrupted file headers on a number of tapes. This problem appears to be the result of the OYO system defaulting to preamp gains upon reboot, and/or that the streamer layout was different than the number of channels the system was actually recording. Correspondence with the OYO software writers suggest that the data are retrievable from these tapes, and that the headers can be rebuilt.

Processing

The original SEG-D-8048 DAT tapes were copied onto exabyte tapes on a SPARC-2 workstation. They were then loaded into the SIOSEIS software package, brought along by Steve Cande on his SUN workstation, and converted to SEGY format. Some preliminary processing and quality control was done using the "ISIS" seismic processing software brought along by Caltech. Unfortunately the system tended to lock up, and often ran out of enough memory to run the various applications.

A significant amount of time was spent attempting to process data with the Seismic Processing Workshop (SPW version 2.6.4) software running on a POWERMAC. The MAC was running system software 7.5.2, with 32 meg of built in memory, and had 6 Gbytes of disk space available for loading data. As had been the case with the previous cruise (NBP9601), we had difficulty loading data from the original DAT tapes, but were successful in loading data from the exabyte copies of the original data.

Numerous problems encountered with the SPW software, as well as unfamiliarity with the quirks of the software, made it difficult to accomplish much processing outside of quality control. These problems included the system locking up, system errors, insufficient

memory, and ultimately corrupted disks. Unfortunately, a hard reboot of the MAC made it impossible to record any associated error messages, or information about where the processing step had failed. Although the SPW support personnel were quick to respond to questions, a number of questions remain unresolved. The most significant one is the fact that the system does not appear to be calculating the correct seismic velocities using parabolic velocity picking functions. We expect that this problem is related to the fact that we recorded data with deep water delays, although this has yet to be confirmed. Attempts to circumvent this problem by using reasonable velocities were unsuccessful. These attempts resulted in strange looking common mid-point stacks which we did not believe.

In many cases the software is carefully documented. However, at times the documentation (which is for an older version of SPW) did not agree with the newer version of the software on the ship. This was especially true for the documentation for entering the cable geometries.

As expected, processing on the MAC is slower than what would be expected for a SUN system. To load 2000 shots of 48 channel data from a 8500 exabyte tape takes approximately 3 hours. Each step in the SPW processing system writes a new data file (using up disk space). Geometry definitions, CMP sorts, etc. for this data can each take approximately 45 minutes, if the system does not lock up.

Dave Leger (ASA) wrote software that uses NGL coordinate files and the OYO shot logfiles from rvdas to generate geometry files which SPW can load from disk. The code for this "spw_geometry" lives in the rvdas utilities area, and is user friendly in that it tells the user what parameters it needs as input.

Recommendations

The following procedures for seismic data processing are recommended for future NBP cruises. If the science party plans to use the SPW processing system, a SUN system should be available for copying the original DAT tapes to exabyte. In addition, it would be preferable that the person responsible for the data processing already have some familiarity with running the SPW software. A significant amount of time was spent just trying to get the software to do simple tasks such as geometry definition, CMP sorts, and receiver gathers. Having previous cruise flow charts available is helpful if the nature of the recording is the same, e.g. same record lengths, sample rates, etc.

If the ISIS processing system is used, a more powerful computer than the SPARC-2 is recommended. In addition at least four gigabytes of disk space should also be available.

NBP9602 - CANDE/STOCK ANTARCTIC CRUISE
MULTICHANNEL & SINGLE CHANNEL SEISMIC CONFIGURATIONS
Recorded on OYO - DAS 1 software version 1.26B

MCS-48 configuration (Seistapes # 1 - 10)

GPS antenna to stern - 44 meters
stern to guns - 53 meters
guns to near channel - 265 meters
5 geophones per channel group (2.5 meters apart)
channel groups - 25 meters long (1200 meters total length)
streamer depth ~ 10 meters
gun depths ~ 5 meters
channels 3, 34, 37 and 46 dead; 4 noisy
deployed 5 - 210 in³ air guns; gun 5 dead, gun 1 injector error

SCS - 5 channel configuration (Seistape # 11)

modification of the multichannel streamer
400 meters of streamer in water
recording five channels (44, 45, 46 (dead), 47 and 48) on channels 1-5
active section = 125 meters (5 -5 geophone channel groups)
GPS antenna to stern - 44 meters
stern to guns - 30 meters
guns to near channel(44) - 245 meters
streamer depth ~ 3 meters
gun depths ~ 5 meters
1 - 210 cubic inch air gun

SCS - 12 channel configuration (Seistape # 12)

modification of the multichannel streamer
400 meters of streamer in water
recording twelve channels (37(dead), 38, 39, 40, 41, 42, 43, 44, 45, 46 (dead),
47 and 48) on channels 1-12
active section = 300 meters (5 -5 geophone channel groups)
GPS antenna to stern - 44 meters
stern to guns - 30 meters

guns to near channel(37) - 75 meters
streamer depth ~ 3 meters
gun depths ~ 5 meters
1 - 210 cubic inch air gun

SCS - 12 channel (summed onto 3 recorded channels) configuration (Seistape # 13)

modification of the multichannel streamer
400 meters of streamer in water
recording twelve channels (37(dead), 38, 39, 40) on channel 10; 41, 42, 43, & 44 on channel 11; 45, 46 (dead), 47 and 48) on channel 12
active section = 300 meters (5 -5 geophone channel groups)
GPS antenna to stern - 44 meters
stern to guns - 30 meters
guns to near channel(37+) - (120 meters) - 100 meter "channel" spacing (150, 250 and 350 meters from stern)
streamer depth ~ 3 meters
gun depths ~ 5 meters
1 - 210 cubic inch air gun

SCS - 12 channel (summed onto 3 recorded channels) configuration (Seistape # 14 - 17)

modification of the multichannel streamer
300 meters of streamer in water - channels 37 and 38 essentially out of the water
recording twelve channels - (37(dead), 38, 39, 40) on channel 1; 41, 42, 43, & 44 on channel 2; 45, 46 (dead), 47 and 48) on channel 3
active section - 300 meters (5 -5 geophone channel groups);
GPS antenna to stern - 44 meters
stern to guns - 30 meters
guns to near channel(37+) - (20 meters) - 100 meter "channel" spacing (50, 150 and 250 meters from stern)
streamer depth ~ 3 meters
gun depths ~ 5 meters

SCS - 12 channel (summed on 3 recorded channels) configuration (Seistapes # 18 - 28)

modification of the multichannel streamer
400 meters of streamer in water
recording twelve channels (37(dead), 38, 39, 40) on channel 1; 41, 42, 43, & 44 on channel 2; 45, 46 (dead), 47 and 48) on channel 3
active section = 300 meters (5 -5 geophone channel groups)
GPS antenna to stern - 44 meters
stern to guns - 30 meters
guns to near channel(37+) - (120 meters) - 100 meter "channel" spacing (150, 250 and 350 meters from stern)
streamer depth ~ 3 meters
gun depths ~ 5 meters
deployed 5 - 210 in³ air guns;

MCS-48 Seistapes # 29 - 54

GPS antenna to stern - 44 meters
stern to guns - 53 meters
guns to near channel - 265 meters
5 geophones per channel group (2.5 meters apart)
channel groups - 25 meters long (1200 meters total length)
streamer depth ~ 10 meters
gun depths ~ 5 meters
*channels 3, 34, 37, 42 and 46 dead; 4, 41 and 46 noisy
deployed 5 - 210 in³ air guns; gun 1 dead (shooting 4 out of 5 guns)
on seistape # 52, guns being pulled to surface periodically due to high waves*

* = line 35956 of list_disk_sun

Not only is there a discrepancy between local time and gmt time as noted in the tape logs, but there is also a skipped day (Julian day 56), which occurs at shot 826.

The discrepancy noted in the log is that the times on tape should be corrected by adding 12:00 hours.

e.g. the start time which is
day:55 hour:20 min:52 sec:30
should be
day:56 hour:08 min:52 sec:30
