Steve,

Only the Trimble GPS receiver has P-code. The Ashtech and the Furuno Navigation is non-P-code. The primary navigation in the Trimble and all the data from your cruise used this source. It is, by the way, exactly the same as is output from NGL. The only difference is that NGL sometimes drops out data: we found that on an average of 50 minutes/day. For that reason the data from your cruise was raw P-code, checked daily. Let me know if this answers your question.

Regards,
Jim
