

TN272 Sonobuoy Submission Description

The sonobuoy data for TN272 are archived at both the IRIS DMC and the UTIG Academic Seismic Portal since the data were recorded on both the SIO hi-res MCS system (on the aux channel) and RT-130s checked out from the PASSCAL Instrument center.

The data submitted to both locations are identical, with two exceptions: 1) this document, 2) the inclusion of the raw aux channel data in this UTIG submission). Note also that the Shot_navigation folder is included in both the UTIG and DMC submissions so that those two submissions remain identical (with the noted exceptions), but these shot-location data are redundant with MCS navigation data that are part of the MCS submission. The MCS data are only archived at the UTIG ASP.

The submission to the DMC was done first, so please refer to the document IRIS_submission_description.pdf for other details on the submission of the TN272 sonobuoy data to UTIG ASP.
