

NZ3D Project Cruise Report

NEW ZEALAND 3D SURVEY

TAKING THINGS TO A HIGHER DIMENSION

Summary

As part of the NZ3D Project, we acquired a 3D seismic data volume along the Hikurangi subduction zone on the east coast of the North Island of New Zealand. This is where the Pacific plate subducts beneath the Australian plate and generates earthquakes and tsunamis from slip occurring along the subduction megathrust. The Hikurangi margin is also the site of regular slow slip earthquakes that are some of the shallowest, and thus most accessible, known to occur in any subduction zone around the world. The NZ3D project conducted a detailed 3D seismic survey for two separate goals. One goal focuses on seismic imaging to examine: 1) the megathrust and infer conditions that control the slip behavior, especially shallow slow slip events, 2) the structure of the subducting plate, especially seamounts and basement roughness that may control the amount of sediment subducted, and 3) the upper plate to infer fluid migration pathways and deformational structures that will reveal fluid migration and tectonic activity. The second goal was to record Langseth shots

fired during the cruise on 100 ocean bottom seismometers (OBS) deployed within the 3D grid prior to the cruise by Japanese scientists and technicians on board the R/V Tangaroa. In addition to these instruments there were ~300 land seismometers deployed around the Gisborne area and across the Raukumara Peninsula. The OBS and land stations were deployed to conduct a 3D full waveform inversion in order to develop a detailed 3D seismic velocity model to infer fluid content and structures within the margin.

The survey was conducted between Jan 6th and Feb. 8th, 2018. During the 34 days at sea we deployed a 4 x 6 km streamer array with each streamer containing 468 channels at 12.5 m spacing. The streamer spacing was 150 m. The source array was a 3,300 in³ array made up of two gun strings of 9 airguns each. The sources were separated by 75 m and were fired in flip-flop mode every 25 m. Record length was 9.5 seconds. We conducted 60 total passes through the survey grid (48 primary lines, two reshoots, and 10 infill lines) with 300 m sail line spacing, for a total survey size of 14 x 60 km.

The OBS were deployed in a 4 x 25 array with nominal spacing of 2 km. The instruments were randomly shifted from a regularized grid by up to a few tens of meters to produce an irregular instrument spacing. The OBS were deployed in mid-December prior to the cruise, and left until mid/late-March to record earthquakes after the NZ3D data acquisition. Land stations (~100) deployed prior to the SHIRE Project acquisition cruise on the R/V Langseth in November/December of 2017 remained in place for NZ3D, and an additional 200 stations were added around the Gisborne area prior to NZ3D acquisition. These additional instruments were provided by and deployed by teams from the UK, primarily Imperial College. The OBS instruments were provided by JAMSTEC and were deployed from the R/V Tangaroa.

Science Objectives

Subduction zones are settings where one plate slips beneath another along a subduction megathrust fault as the subducting plate moves back into the mantle. Around the world subduction zones generate over 90% of the world's seismic energy and produce the most powerful and destructive earthquakes and tsunamis. While most subduction thrust faults along some subduction zones accumulate strain over hundreds of years and release it in a matter of seconds to minutes during great earthquakes, such as the 2011 Tohoku earthquake and tsunami and the 2004 Sumatra event, others release the accumulated strain less destructively through other fault slip mechanisms. One such recently discovered slip mechanism is slow slip rupture, where strain energy is released during slip that occurs over periods of weeks to months. What controls fault slip behavior is virtually unknown but is critical for understanding and assessing global seismic hazards.

The subduction zone along the east coast of the New Zealand North Island regularly (~ every 2-4 years) produces unusually shallow slow slip earthquakes. These earthquakes occur as shallow as 2-4 km below the sea surface, unlike other known slow slip fault systems in SW Japan or the Cascadia subduction zones, where slow slip occurs at 30+ km depth. Because of this, the earthquakes near New Zealand North Island are some of the best documented slow slip earthquakes in the world.

For this project we acquired a 3D seismic survey designed to image the New Zealand subduction zone structure and map subduction zone fault systems to determine the faulting network and its interaction with the subduction megathrust. These data will enable us to measure physical conditions along the subduction zone megathrust fault to determine what conditions are associated with slow slip behavior, how they differ from conditions associated with subduction zones that generate great earthquakes, and what controls the development of slow-slip faults instead of earthquake prone faults.

In early January 2018, we set sail on the *R/V Langseth* to acquire a 3D seismic reflection data set in a 15 x 60 km area offshore New Zealand's Hikurangi trench and forearc. We used 4-6,000-meter-long seismic streamer spaced 150 apart, each with receivers spaced at 12.5 m that would image a 300 m wide swath of the subsurface with each pass through the survey area. We used two seismic source arrays that generated a source signal alternately from one then the other, every 25 m along the track. These data will be used to construct images of the sub-seafloor structure that can be interpreted to map faults, deformation patterns, fluid migration, and properties of the sub-seafloor material such as density and porosity to infer rock types, fluid migration, and potentially identify areas of high fluid pressures within the rocks. These data would complement the International Ocean Discovery Drilling program that drilled in the 3D survey area to recover rocks that we have imaged in our 3D volume. The combined seismic images and drilling results would allow us to conduct a broad assessment of characteristics of the rocks that cause slow-slip rupture along the Hikurangi margin and allow us to understand earthquakes in subduction zone settings all over the world.

Basic Cruise Information

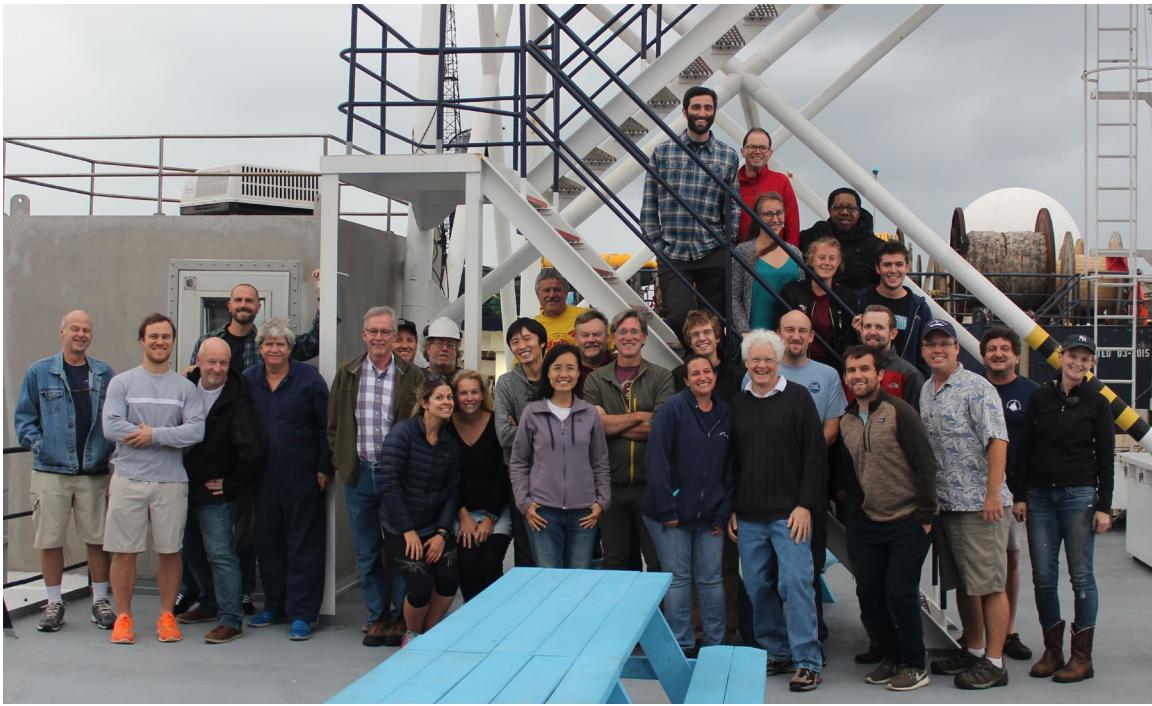

Marcus G. Langseth Cruise - MGL1801	Total Days Departure to Arrival: 34
Cruise Start Date: January 6th, 2018	Arrival Port (end of cruise): Napier, New Zealand
Cruise End Date: February 8th, 2018	
Departure Port (start of cruise): Tauranga, New Zealand	Total Sail Kilometers of Source Data 5489.25 km
Seismic Source: 2 Strings of 9 guns each, 3300 in³ shooting in flip-flop mode; 7 m source depth	Total number of shots - 143078
Seismic Streamer Active Length: 5850 m; 4 x 468 channels at 12.5 m group spacing; 150 m streamer spacing; 8 m streamer depth; source to channel 1 offset is 174.7 m	Total number of sequences - 62
	Survey area 14.7 x 60 km

MGL1801 participants

Instrumentation

Seismic Equipment/Parameters

Seismic Source

Source type	BOLT Air-Sound Source
Shot interval	25m in flip-flop mode (25 m between source 1 and 2 shots)
Number Sources	2
Source depth	7 m per IHA permit application
Volume	3300 in ³
Air pressure	1900 +/- 100 psi
Source separation	75 m
Max timing error	+/- 2 ms

Seismic Streamer Geometry

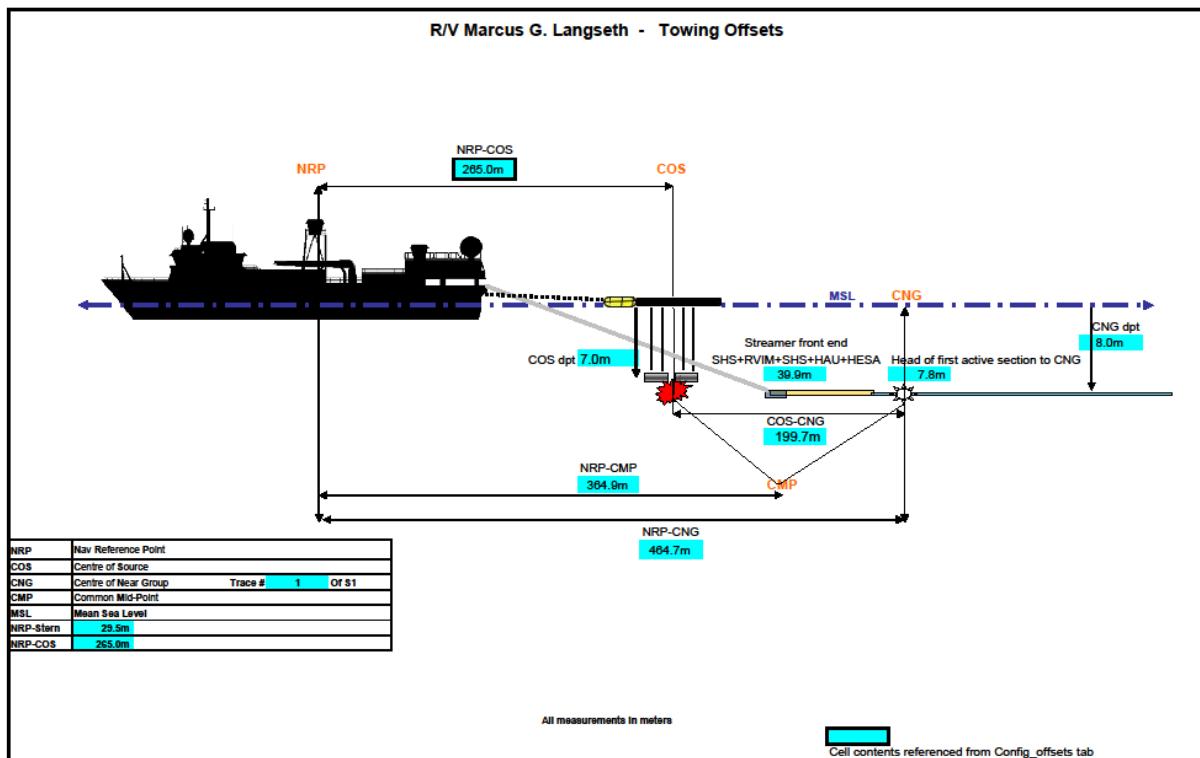

Figure 1. Schematic showing the typical towed equipment geometry. This includes streamer and airgun towing. During the acquisition there were several adjustments made to the offsets. These are noted in the text.

Source-Receiver Offsets

Sequence 001

Source-reciever offset – 199.7m

Sequences 002-004

Source-reciever offset – 174.7m

Sequence 005-009

Source-reciever offset – 164.7m

Sequences 010-011

Source-reciever offset – 169.7m

Sequence 012-060

Source-reciever offset – 174.7m

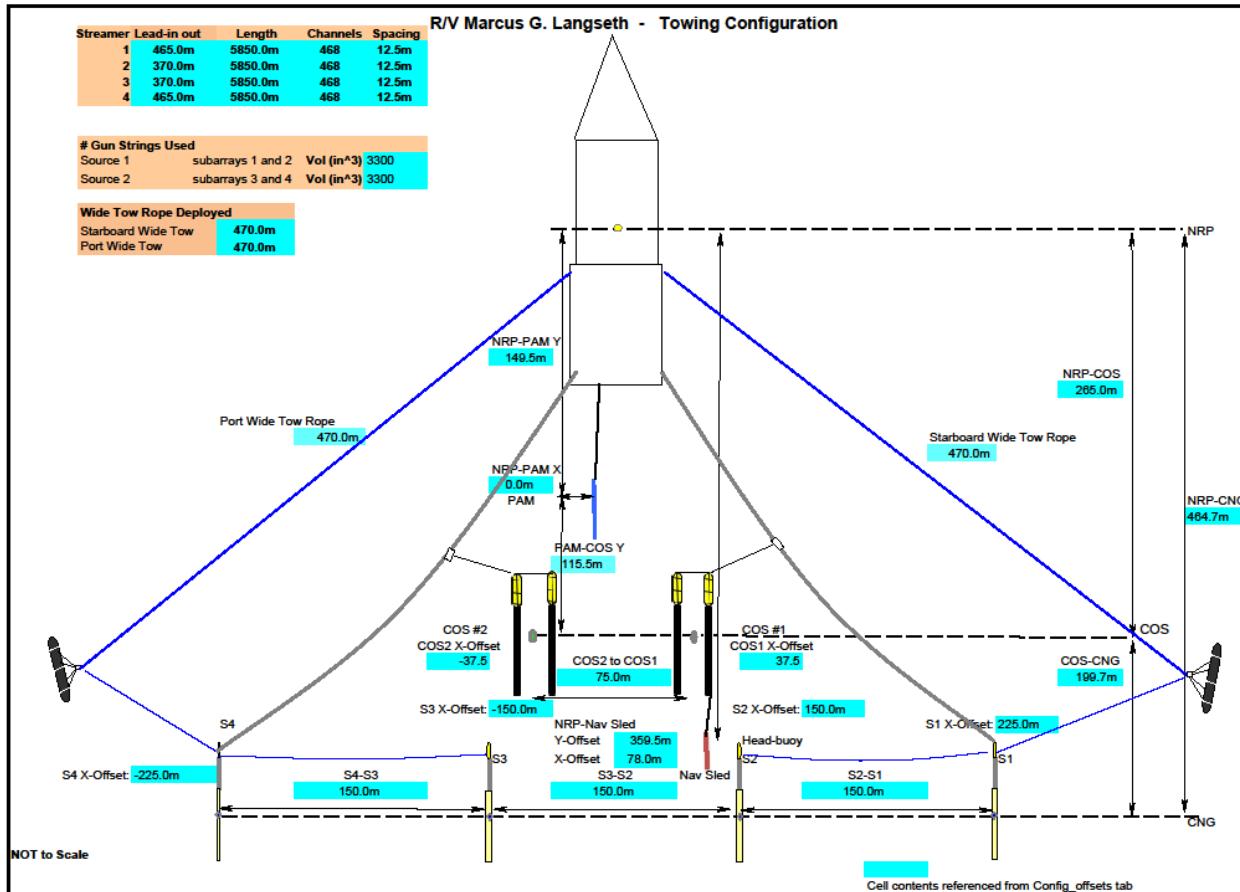

Figure 2. Schematic of streamer layout in 3D mode. Blue lines are tow ropes and separation ropes. Yellow rectangles at the bottom of the figure are streamers. Yellow rectangles connected with black rectangles represent source strings. Lengths are given in blue rectangles.

Seismic Source Geometry

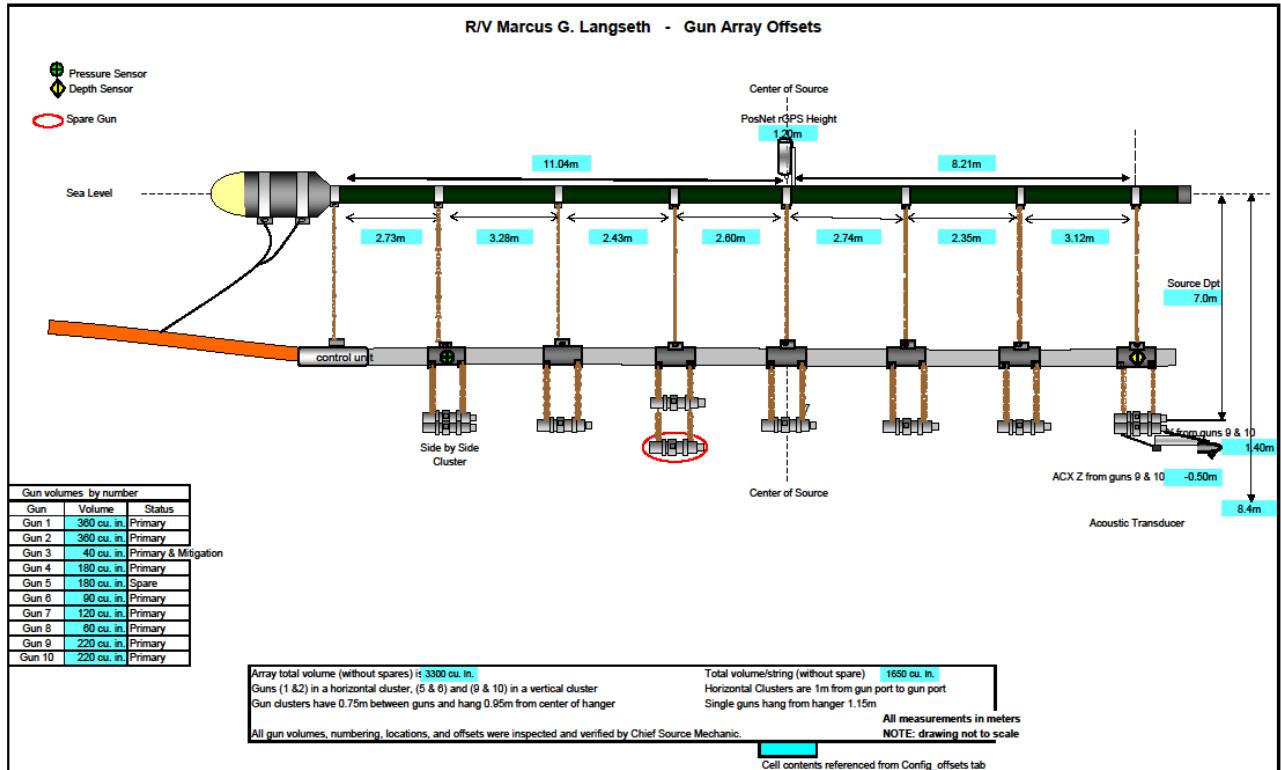

Figure 3. Schematic of source string geometry. Shown is gun configuration for one of four gun strings. Each gun string is identical to geometry shown here.

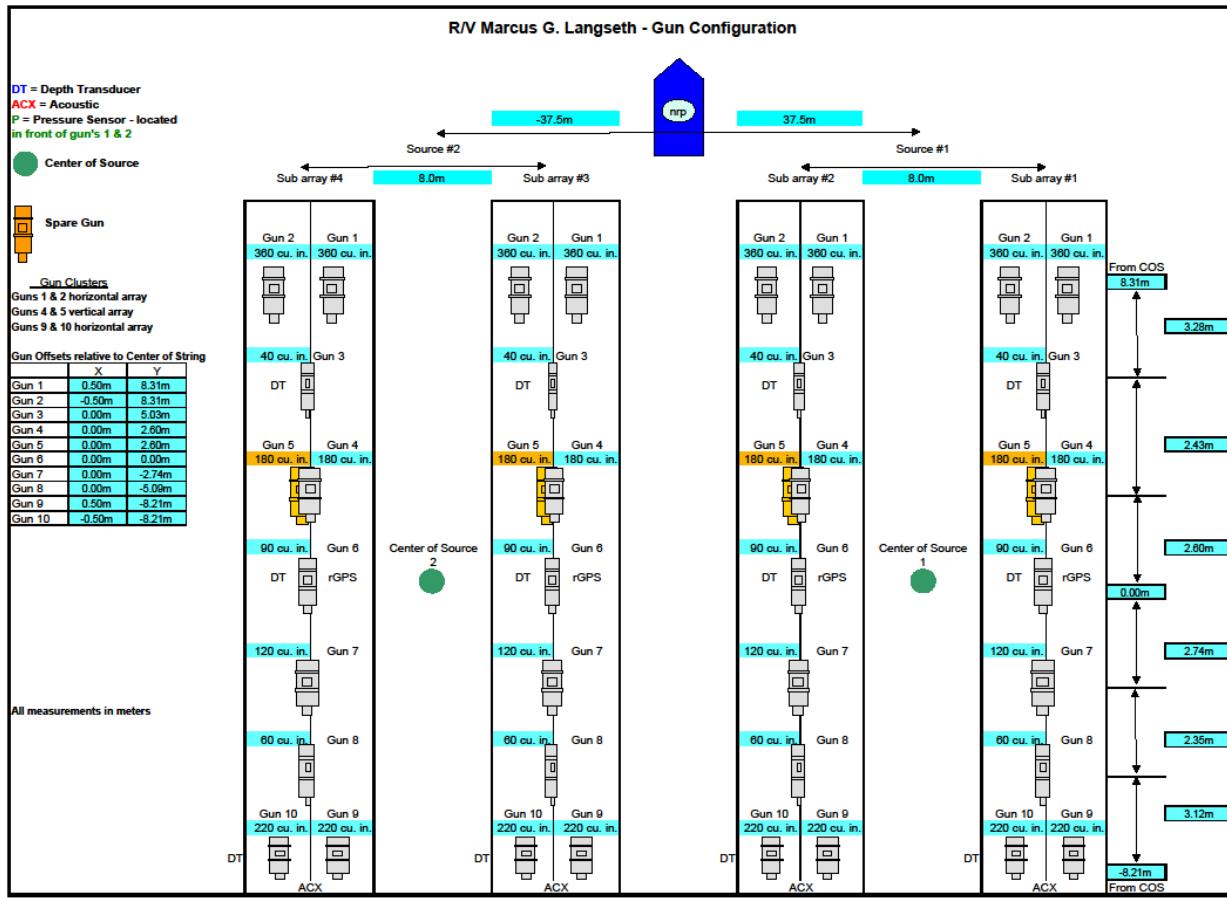

Figure 4. Schematic diagram of the gun string geometry in plan view showing all four gun strings. Each source used two of the four gun strings.

Other Instrumentation

Kongsberg EM122 multibeam echosounder: Our IHA permitted acquisition of EM122 swath bathymetry only when shooting airguns. Continuous acquisition (with a few minor gaps) began on January 6 at ~1230 UTC and ended on February 6 at ~ 1900 with completion of the MCS survey. Data acquired within the 3D grid were acquired using a narrow fixed beam width at 2000 m, rather than a fixed beam look angle where the beam width would vary as a function of water depth. This was intended to increase both the along and across track seafloor resolution within the 3D grid. The broader beam was not necessary given the extensive overlap (~ 6 times) from the 300 m sail line separation. An automated data cleaning process using mbsystems was implemented to remove noisy data points. Data were gridded with a grid spacing of 5 m.

Raw data can be downloaded from the Rolling Deck to Repository (R2R) web site (<http://www.rvdata.us/catalog/MGL1801>). Data will also be incorporated into the Global Multi-Resolution Topography (GMRT) data base, available through GeoMapApp (www.geomapapp.org).

Expendable Bathythermograph (XBT): XBTs were generally acquired once every 3 days. A total of 10 XBTs were deployed including eight T5-series and two T7-series. XBT sites are given in Table 1.

Data are open access and can be downloaded from the Rolling Deck to Repository (R2R) web site (<http://www.rvdata.us/catalog/MGL1801>).

Knudsen 3260 3.5 kHz subbottom profiler: Like the EM122, Knudsen 3.5 kHz data acquisition was restricted to when seismic data were being acquired. Data were saved in keb-format (binary data files, which can be replayed using Knudsen post-cruise playback software) and converted to SEG-Y format. ASCII files containing parameter settings and navigation information were also recorded (kea-format). The Knudsen ping rate was not synced with the EM122, improving the quality of the 3.5 kHz data. Acquisition began on January 6 at ~1230 UTC and ended on February 6 at ~ 1900, when acquisition of MCS data was complete.

Data are open access and can be downloaded from the Rolling Deck to Repository (R2R) web site (<http://www.rvdata.us/catalog/MGL1801>).

RDI 75 kHz Acoustic Doppler Current Profiler: ADCP data were acquired throughout the cruise at the 75 kHz. Data were processed during the cruise using University of Hawaii UHDAS software. For each day of the cruise, the archive includes map views of shallow current speed, direction and sea surface temperature, and of the north-south and east-west components of the current as a function of depth versus time, latitude and longitude (i.e. 4 plots/day for 75nb and 4 for 75bb).

The raw data, plot archive, and reprocessed data are available from the Joint Archive for Shipboard ADCP data at the University of Hawaii (ilikai.soest.hawaii.edu/sadcp/) or from the R2R web site (www.rvdata.us/catalog/MGL1801).

Bell Aerospace BGM-3 gravimeter: Gravity data were acquired during the MGL1801. The gravimeter was calibrated in Tauranga, NZ prior to the cruise. An ad-hoc correction was applied to the data to display approximate gravity readings for monitoring by the watchstanders but only raw count data were saved.

The gravity data, along with calibration information, navigation, and ship acceleration data, is archived at R2R (www.rvdata.us/catalog/MGL1801). R2R staff will correct gravity data and make free-air anomaly data available to the community in a timely manner. Data will be open access as soon as they are archived.

Meteorological and seafloor temperature/salinity data: Data acquisition was running during the entire cruise. We had reasonably good weather for the whole cruise. Swell was < 3-4 m most of the time. There were occasional white caps with winds up to ~35 kts, but winds were never sustained long enough to build up a large, local swell. Most of the swell was generated from storms to the south and travelled into our survey area.

Data can be downloaded from the Rolling Deck to Repository (R2R) web site (<http://www.rvdata.us/catalog/MGL1708>).

Detailed Track Maps

NZ3D Survey Track Map

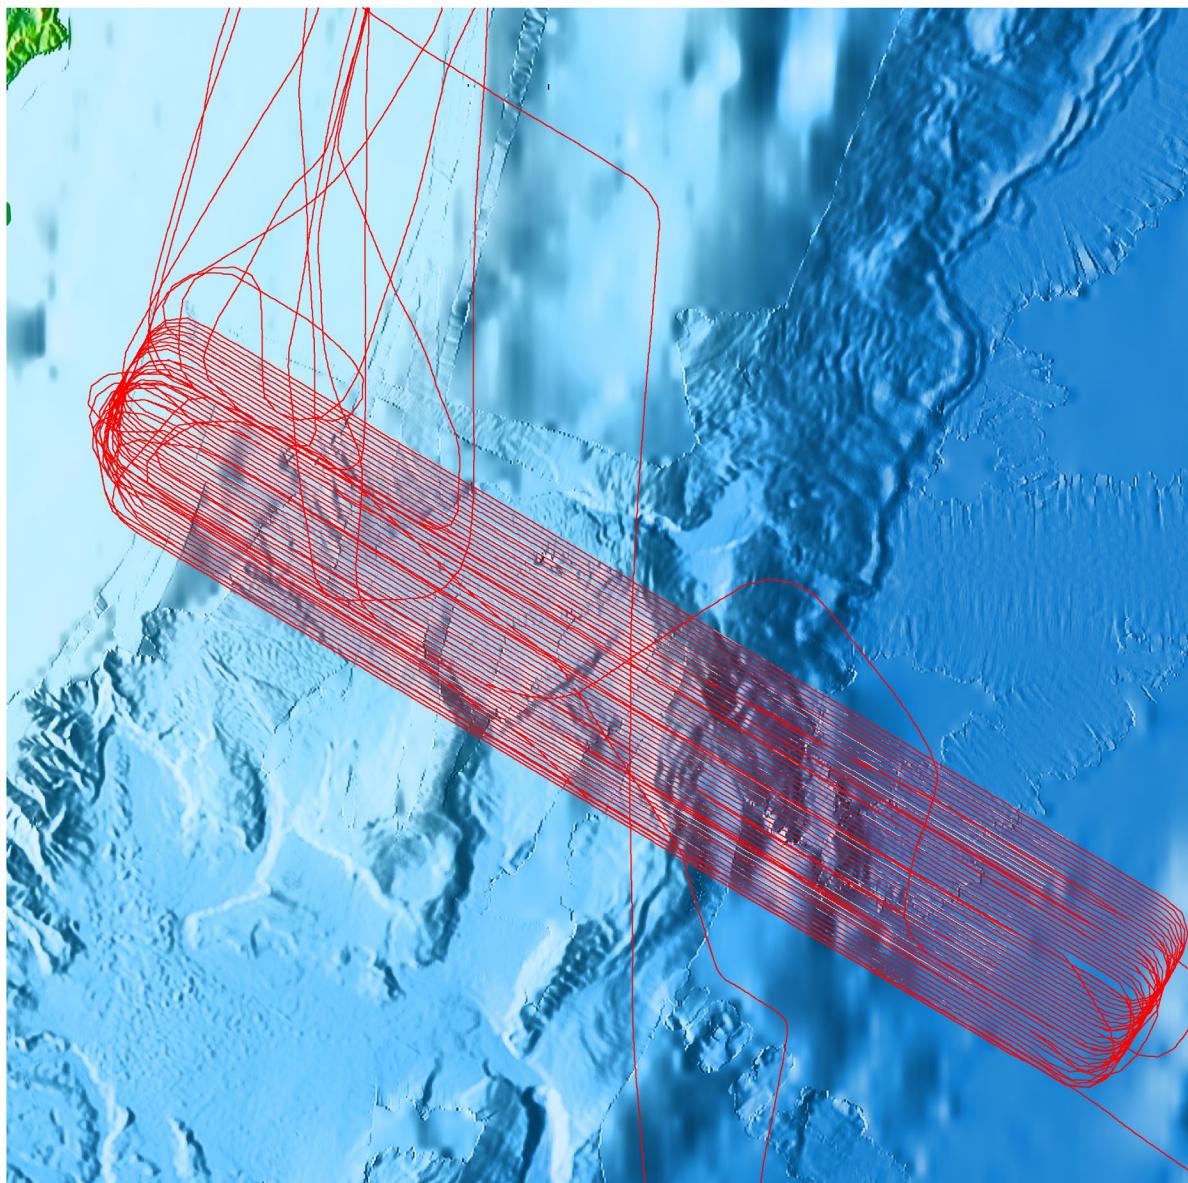

Figure 5. Track map within the 3D survey area during MGL1801. Green area in the upper left is shoreline near the Gisborne, NZ area. Turns in the southwest corner of the grid were restricted by shallow obstructions.

Coverage Maps

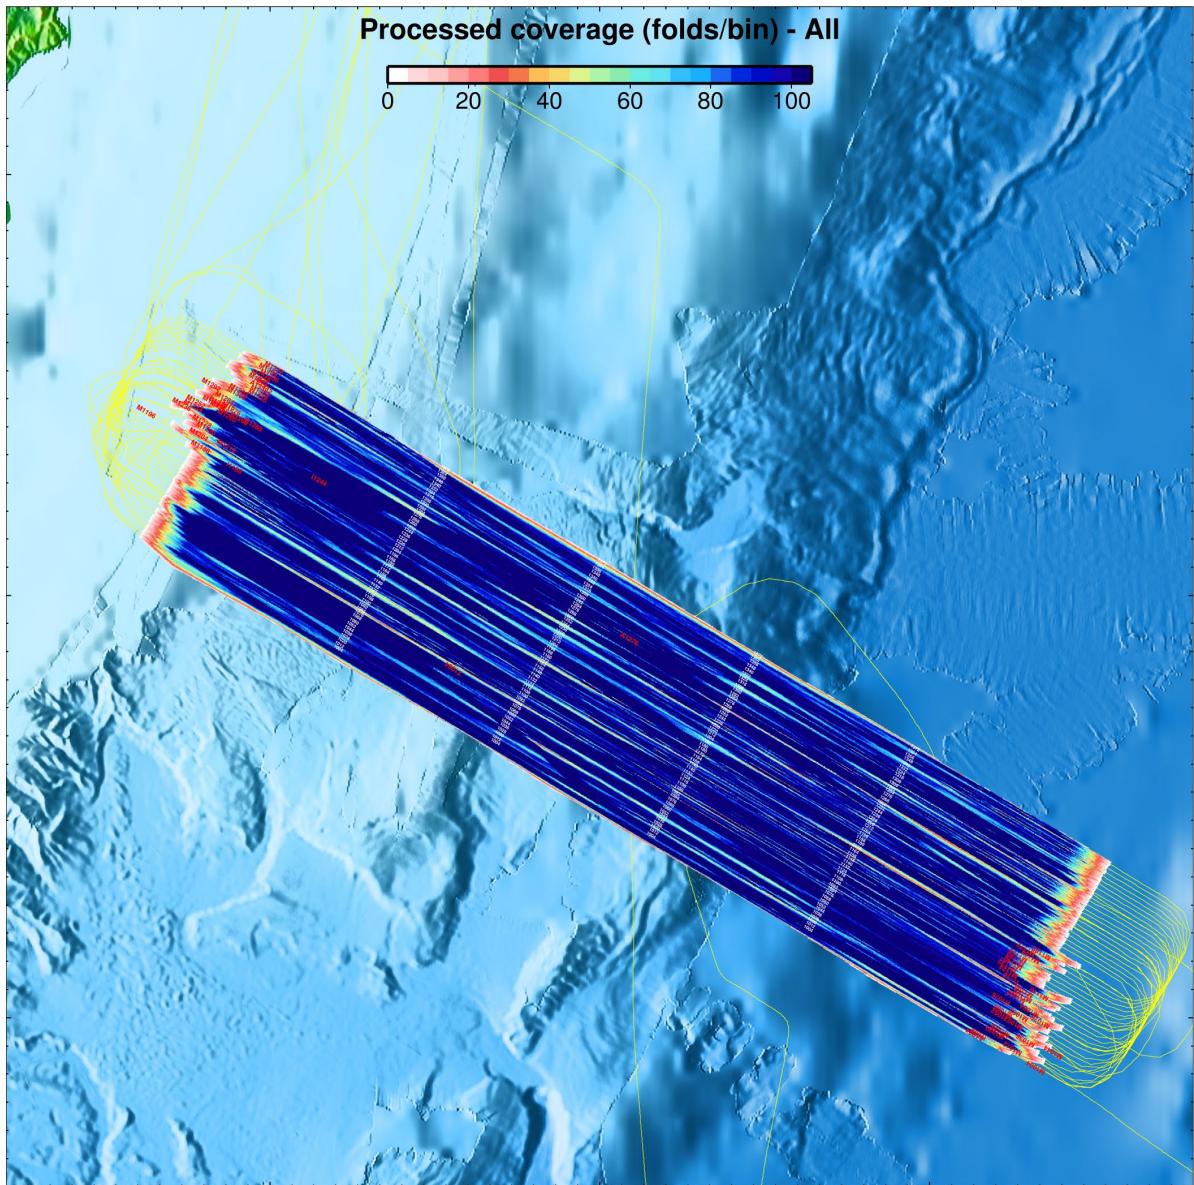

Figure 6. Bin coverage using all traces in the gathers. Bin size is 25 x 37.5 m. Note that coverage is nearly complete with no gaps between lines and few regions of low coverage.

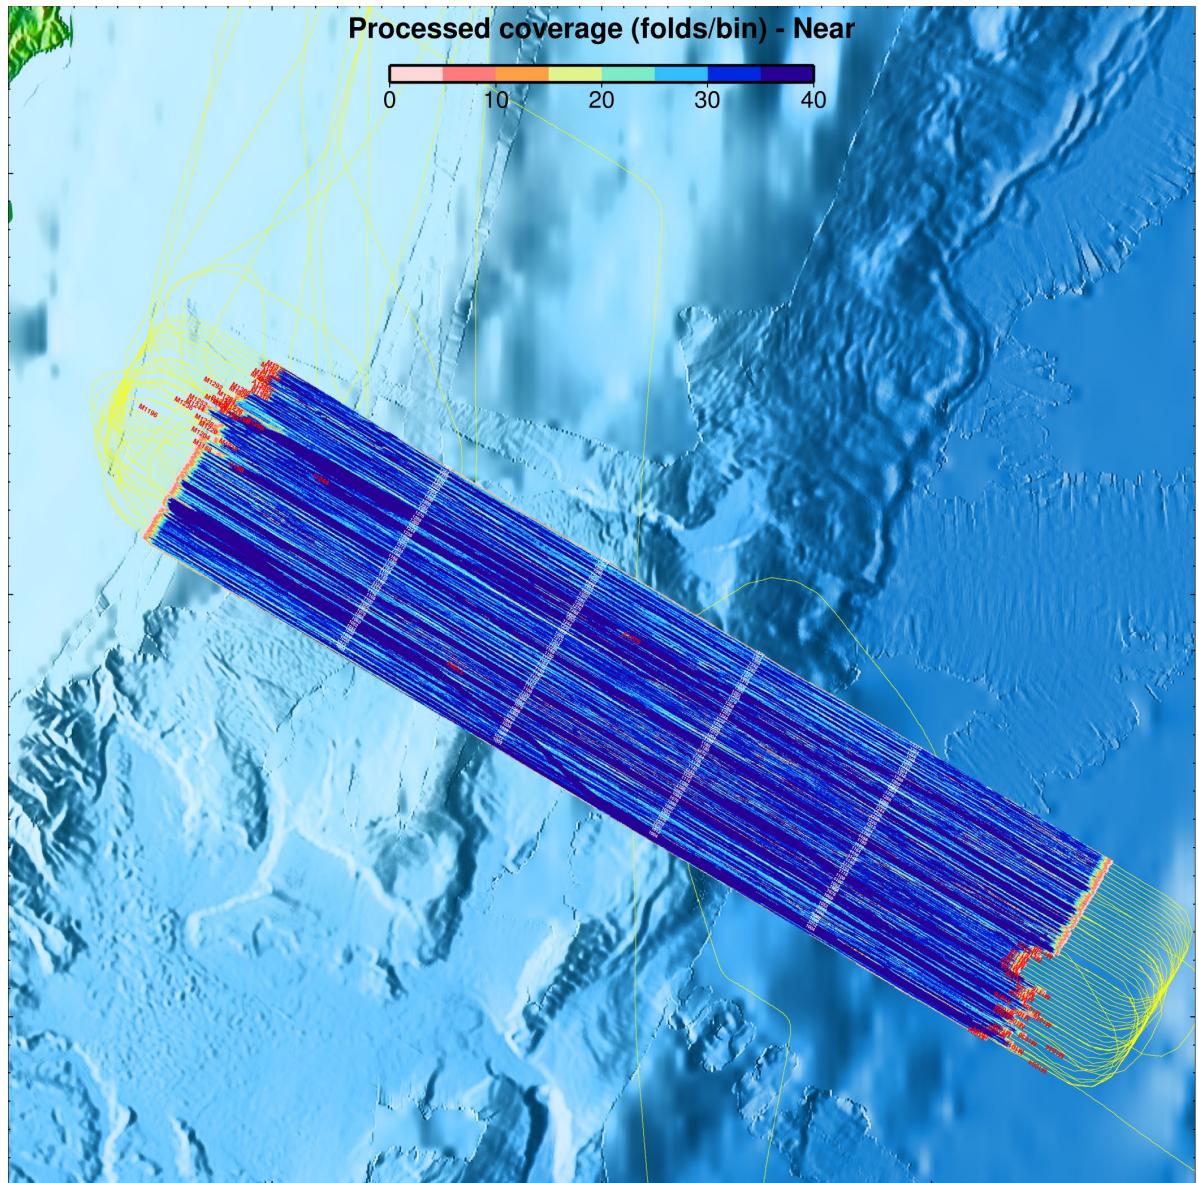

Figure 7. Bin coverage using traces in offset ranges up to $\sim 2,000$ m. Bin size is 25×37.5 m.

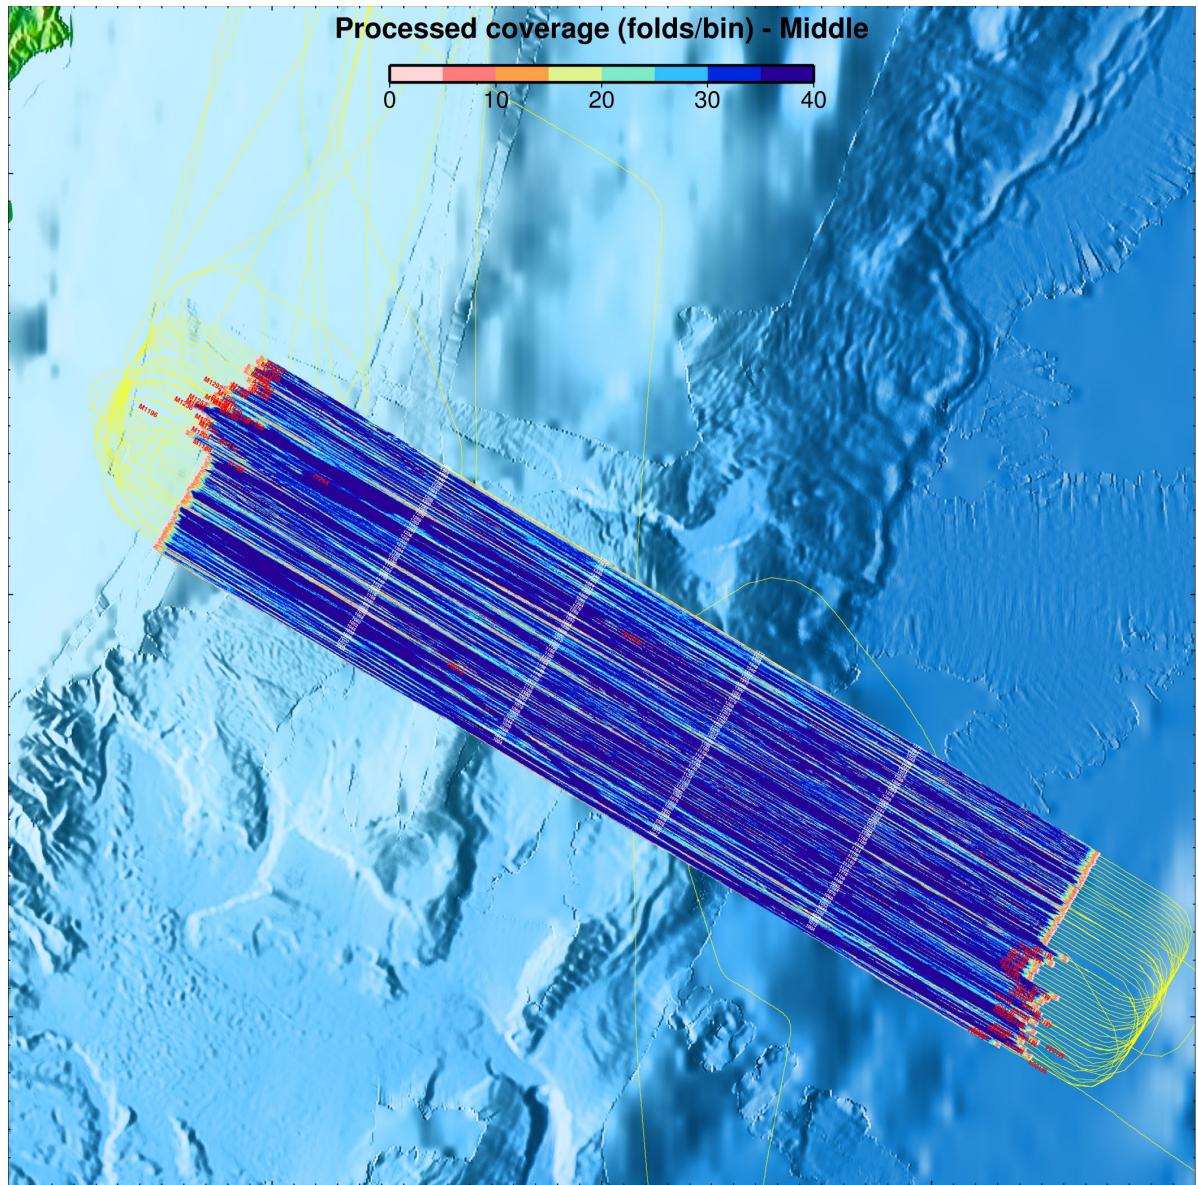

Figure 8. Bin coverage using traces in offset ranges between 2,000 m and 4,000 m. Bin size is 25 x 37.5 m.

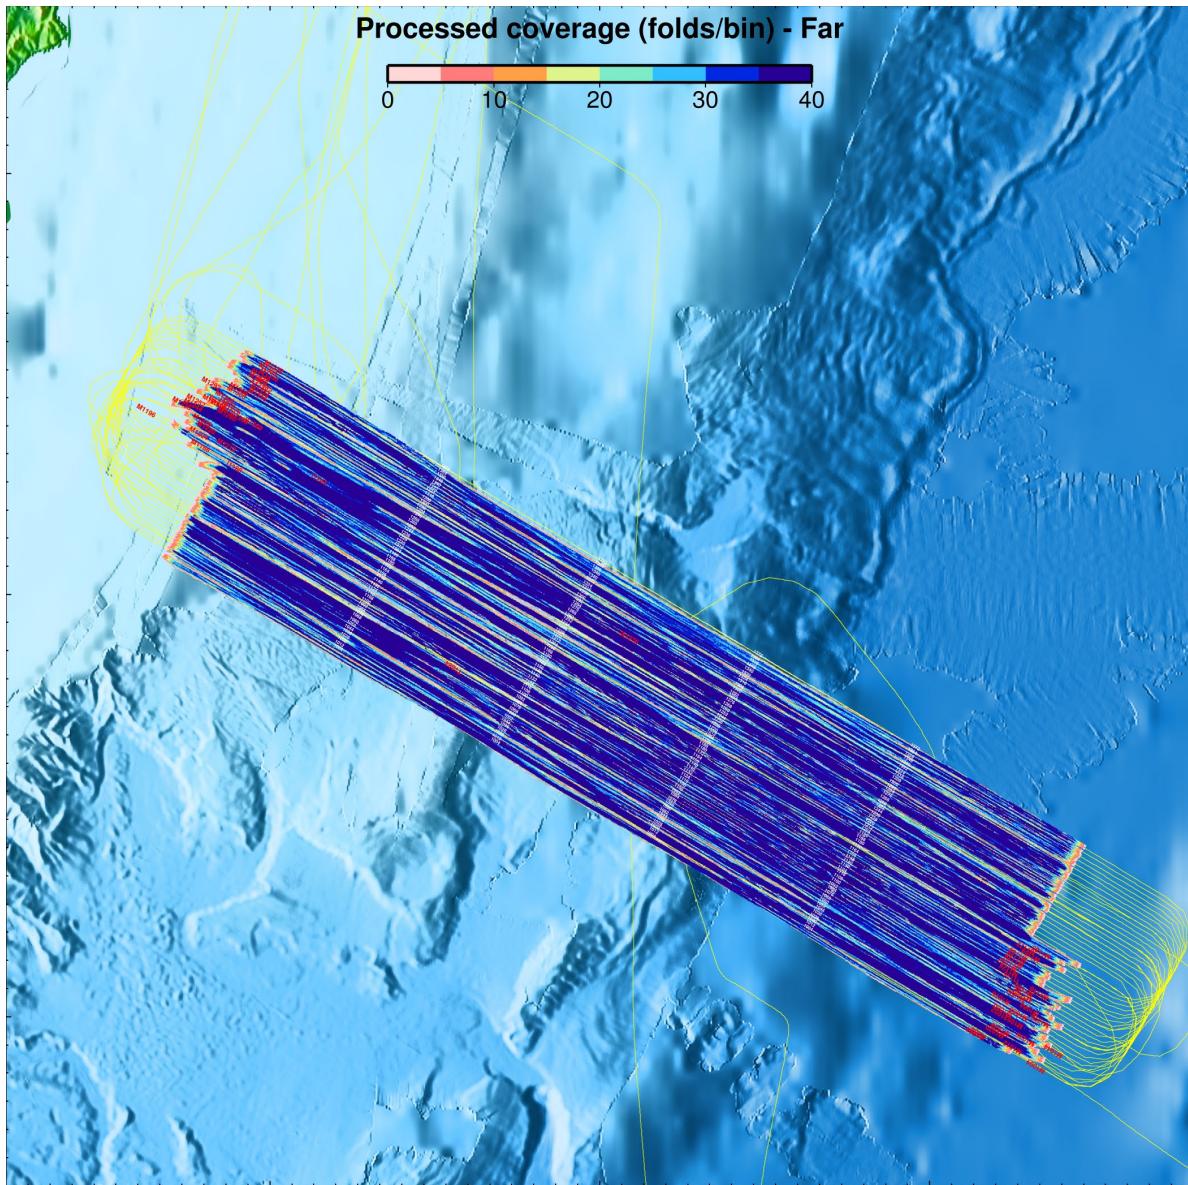

Figure 9. Bin coverage using traces in offset ranges between 4,000 m and 6,000 m. Bin size is 25 x 37.5 m. Variations in currents between passes caused some low fold coverage in the intermediate water depth areas, but overall coverage is excellent for the fare

Line Names and the 3D Grid

Lines are named as cruise number, line type, and number within the grid.

Example: MGL1801M1004

Cruise Number:	MGL1801
Acquisition Type (Main) -	-----M (and sometimes A, B, I, R, T)
Line Number:	-----1004

Acquisition Type

- A – reshoot #2
- B – reshoot #3
- I – Infill
- R – reshoot #1
- T – reshoot

Note that sequence 20 is labeled as MGL1801M1268A, with the A at the end to indicate a reshoot. This is the only line with this convention.

Lines were acquired using a 25 m x 37.5 m grid. The grid origin is utm 679919, 5676560 at the intersection of inline 1 and crossline 200, and azimuth is 121.9/301.9. The numeric ordering of the lines start at the southeast corner of the grid and increase to the northwest. The lowest numbered sail line is line 1004, and the highest is 1372. The spacing between sail lines is 8 grid lines. Sequence numbers indicate the shooting order. Note that some of the infill lines are labeled with a single line number, but target infill on multiple lines.

Cruise Narrative

Note all times are local time (UTM +13)

Jan. 4- Jan. 5

The science party arrived in Tauranga despite heavy rain and high winds. All joined the Langseth except Shuoshuo Han who was delayed by the weather.

Jan 6.

Shuoshuo arrived in Tauranga and joined the Langseth. We began the day with a safety meeting at 8 AM. Despite our plans to leave at 1000 we waited for last minute spare parts to arrive and we were loaded by 1300. We left the dock at 1330 and steamed out to 12 nm offshore to begin some streamer work.

We deployed the streamer 4 for trim work starting at 1830.

Jan 7

We continued with streamer work. We retrieved Streamer 4 at 0330 and cable trim work began on Streamer 3.

We recovered streamer 3 1330 and we began steaming around the Raukumoro peninsula to the 3D site.

Jan 8

We arrive near the 3D survey area and began streamer deployment at 0015 in an location to the north of survey. Streamer 4 was deployed first, followed by Streamer 1, 3 and 2. Streamer deployment went well, but slower than expected. Streamer 3 had a bad stic cable at the tail buoy. This is one that failed during MGL1708 and was repaired. The repair failed. Consequently the GPS on Streamer 3 did not work; however, this did not impact the streamer navigation. All networks came up and ran well. There were 3 acoustic networks at the tail, and two in each of the middle and head. Streamer 3 was deployed missing a stretch section because of an earlier failure and no spare.

Jan 9

Streamer deployments finish ~ 1:00 AM. Gun deployment began. Additional time was needed to rig up the guns. One of the streamer separation ropes broke and needed to be replaced. This work was finished ~ 3:00 AM. We then headed for the prospect to start the first line. However, there was a problem with firing in flip-flop mode. Spectra was not handling it correctly and was only able to fire one of the sources. As we headed down the first line, we continued to troubleshoot the flip-flop firing issue.

Jan 10

Gun firing problem was found ~ 1:30 AM. The main issue was that Spectra was not sending the gun string firing mask to tell one set of guns not to fire during the flip-flop firing. This was fixed by rebuilding some of the Spectra parameter files. This occurred after several

systems have been replaced since the last 3D acquisition. This could not have been tested at the dock and could only be tested by firing.

We began acquiring our first line at ~ 7:30 AM. There was an issue with the shot numbers for ffids 3-1109 not set at the right value. This was corrected at ffid 1110 and new SEG-D files (Tapes 1-3) were written with the corrected shot numbers.

Jan 11

Data acquisition was going very smoothly. The weather remained calm and all systems were working well. Some adjustments to the separation ropes were needed in order to even the spacing between guns and streamers slightly. There was slightly lower coverage in the center.

Jan 12

Smooth acquisition. We started our seminar series. Nathan presented an overview of the NZ3D project.

Jan 13

Data acquisition went very smoothly.

Jan 14

Jan 15

We noticed a static shift in the gravimeter of ~ 400 mgals, too large to be real. This will have to be examined once we have a gravity tie in port. Harry and Melissa gave presentations on the land station deployments and the FWI work conducted by Melissa.

Jan 16

Winds picked up and waves grew to 2-3 m. The data were a bit noisier than previously in the cruise. The swell was fairly small, but it was very choppy.

Jan 17

The weather picked up with 40 kt winds and choppy seas. This created more noise on the records. Operations broke off during Line 1268 and we pulled in the guns and headed into the seas to wait out the weather. While we waited, we did gun work and we swapped out the PAM cable with a spare.

Jan 18

The weather improved and the guns went back in the water at 0400. As the guns went out, the air line for string 4 jumped the reel and got caught under the flange of the winch. It was too badly damaged to use and had to be changed. Tailbouy 2 GPS failed leaving working GPS only on 1 and 4. The acoustic network was still working well and provided adequate positioning. Ryuta gave a presentation on Ryukyu subduction system and Shuoshuo presented results from the Oregon margin.

Jan 19

The weather remained rough, which caused the data to still be a bit noisy. The weather calmed down throughout the day.

Jan 20

The weather was clam and the acquisition went smoothly.

Jan 21

The acquisition went smoothly. Joel and Tim give seminar presentations on Costa Rica frontal plate-boundary thrust and Galicia rifted margin 3D.

Jan 22

Data acquisition continues smoothly. Gun String 1 had problems with the communication lines.

Jan 23

Because of such good weather and no protected species shutdowns, we expected to finish shooting the current 14 x 60 km grid on ~ Jan 31st. We discovered that because of minimal current and good weather, the necessary reshoots to infill will be minimal. Consequently we wanted to add additional lines during the time that we expected to have following completion of the 14 x 60 km grid; however it appeared that we would not be able to extend the grid because the permit restricted total line km that we were allowed to shoot. We would reach that limit during the small amount of infill that we needed to shoot.

Jan 24

Harold gave Nankai drilling summary in seminar. The weather was particularly calm and Robert took the work boat out to check on gear and replace tailbuoy strobe lights. There were lots of great pictures taken from the work boat.

Jan 25

Gun string 3 had multiple issues regarding communications cables. The guns were retrieved and we aborted Line M1332 just after starting. We turned and looped around, which took about 3 hours and gave us enough time for gun repairs. Chafing through the main communication line caused one problem and other solenoid cables were found to be faulty. Weather remained calm.

Jan 26

Weather remained calm with some swell. Data quality was good.

Jan 27

We picked up some fishing gear that could not be seen in time to avoid. Robert went out in the work boat and picked it off from the guns. All of the fishing gear on the streamers could

not be removed, but it did not seem interfere with the data quality. Dan gave a lecture on the Kaikura earthquake.

Jan 28

Operations went smoothly.

Jan 29

Jan 30

The acquisition went very smoothly. Stephen gave a presentation on photogrammetry of an outcrop in Spain and Harry gave one on active faults in central Italy. We also field questions from Franklin and Marshall that Stephen received about slow slip and our project.

Jan 31

We completed the coverage linking the two survey swaths by making a pass up through the center on line 1180, which stitched the two halves together. We returned to start a reshoot of line 1268 and the weather pick up as Cyclone Fehi passed across the S. Island. The winds kick up to 40+ kts and the ship could not hold the line. We broke off the line at ~ 2:00 PM and headed for the coast to find the calmest possible waters to wait it out.

Feb 1

The weather remained rough and we stayed close to shore. Streamer 4 began to act up with flaky electronic issues. Dave discovered a solution that required keeping the power to the tailbuoy off as much as possible and turned the power on only to recharge batteries. This was expected to be an adequate workaround for the remaining of the cruise.

Feb. 2

This was a busy day. The weather began to settle down and we headed back south to the prospect to begin doing the reshoot of line 1268. At ~ 1:30, as we approached the start of the line and we hit fishing gear. We picked up a lobster pot on Streamer 3. The lobster pot gets snagged on Bird 5. This required pulling in the guns and bringing in Streamer 3 to Bird 5 to remove the fishing gear. This was finished ~ 6 PM. Once the gear was back in the water we head back to the prospect. We steamed onto the south end of 1268 so that we could make a turn to start acquiring data on Line 1078 after the turn. As we turned to come on to the line, Streamer 3 died at the first module and could not be fixed in time to begin the line. We continued down the line trying to fix it with no luck. We decided to bring in the beginning of Streamer 3 to change the module. After bringing in gun Strings 3 and 4 we decide it is too rough to maintain the course and head with the seas to the north. With the heavy weather we decided to bring in both Strings 1 and 2 so that we don't have to pick them up if it gets worse. Once they were in we began to move the port paravane in to release Streamer 3 in preparation for bringing Streamer 3 in. Once it was ready to bring in we discovered that the streamers were working again. We then decided to head back to the prospect and began testing everything by shooting a reshoot line, Line 1084.

Feb. 3

The weather picked up again and we had to abandon the acquisition. We headed for shallow water to wait out the weather. Winds were 30+ kts.

Feb. 4

The weather began to calm down. When it got to ~ 20 kts we began to shoot a reshoot line on a 220 heading. However, the noise was still pretty bad due to the large swell. The swell did not die down until the late afternoon. Consequently we shot with streamers at 9 m to help suppress the noise on the records .

Feb. 5

We began Line 1268 for a 5th try at completing this line. This time the weather was not too bad and we were able to move the streamer back to 8 m. Acquisition looked promising for acquisition of a few lines in the time remaining until we had to head to port.

Feb. 6

Streamer 4 was frequently becoming flaky by “unbuilding” itself. It would unbuild itself by shutting down successive modules within the streamer. Some shots were lost during the time needed to correct the problem and rebuild the streamer. The rebuild succeeded each time without failure during the rebuild.

Feb. 7

At ~ 9 AM, as we finished line A1004 along the outside of the grid, we turned to begin the last of the infill lines. At this point the tailbuoy lost GPS and there was a problem with communication with the birds on Streamer 1. The GPS is critical for locating the network and streamer navigation. GPS is required on Streamers 1 and 4 in order to obtain a solution for streamer navigation. The GPS 2 and 3 had already quit. In order to fix the GPS on Streamer 1, we would have to retrieve the streamer completely. There was not enough time left in the cruise to fix this problem and we end acquisition. After we retrieved the streamer we discovered that the covering at the head of the streamer, where it is attached to the tow ropes, had cracked and instead of distributing the stress along the cable, it was focusing it on the cracked area. This caused the wires inside to fail. As we brought in the streamers we found a large amount of fishing gear attached to the birds. Fortunately we did not have much noise problem due to this gear. The rest of the day was spent bringing the gear.

Feb. 8

We continued to bring in the gear. We had some streamer winch issues with hydraulics, but all gear was retrieved by noon and we headed for port. We reached port by ~ 7:00 PM.

Feb. 9-10

We pack up our computer equipment and prepare to leave the Langseth. The science party departs.

Seismic Acquisition Examples

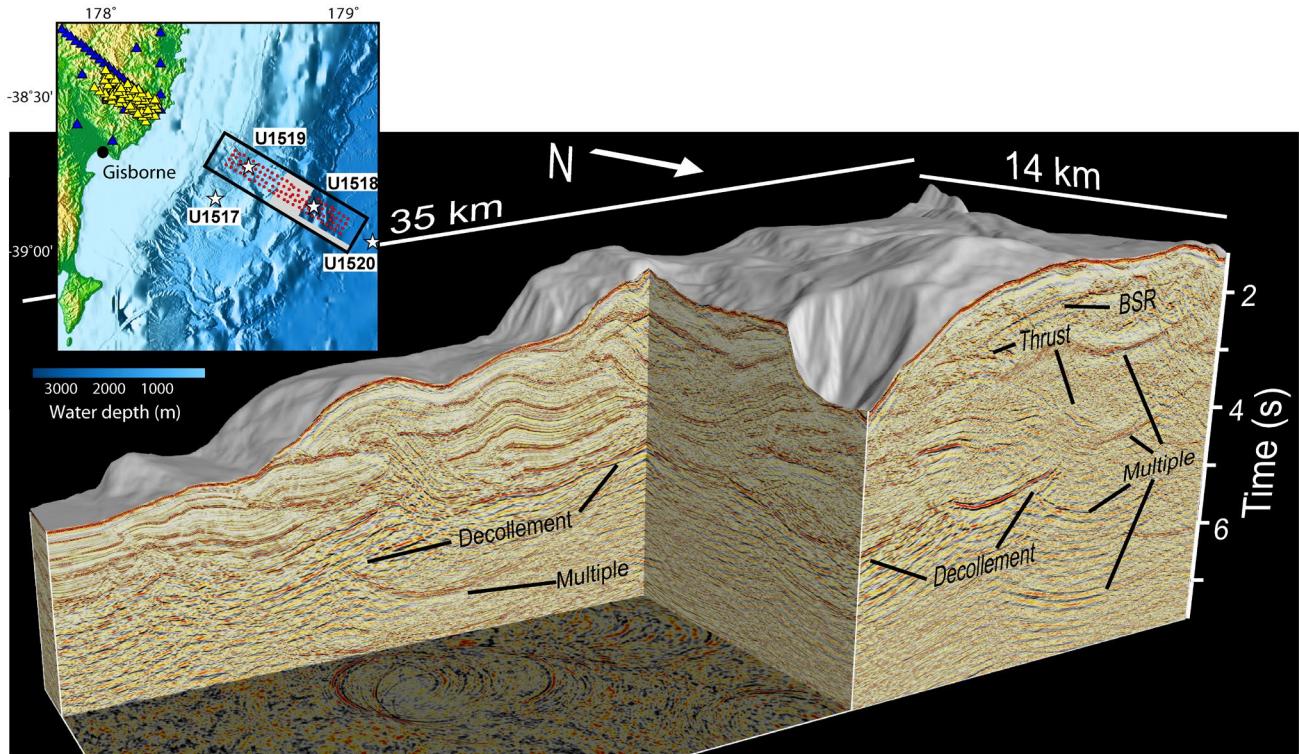

Figure 10. Frontal region of the NZ3D seismic data volume. Preliminary post-stack 3D time migration conducted during MGL1801. Gray shading shows multibeam bathymetry overlying the seismic image. Inset: Bathymetric map of the northern Hikurangi margin. The 3D seismic volume covers a 14 x 60 km area offshore Gisborne, NZ (black rectangle). Gray shading shows outline within the 3D area of the seafloor depicted in the data cube. Red dots are locations of 100 OBS deployed to record Langseth shots during NZ3D. White stars are IODP Expedition 372 and 375 drilling locations. Blue triangles show locations of onshore seismometers deployed for the SHIRE project and left in place to record Langseth shots during NZ3D. Yellow triangles are onshore seismometer locations for instruments deployed for NZ3D.

Data Handling

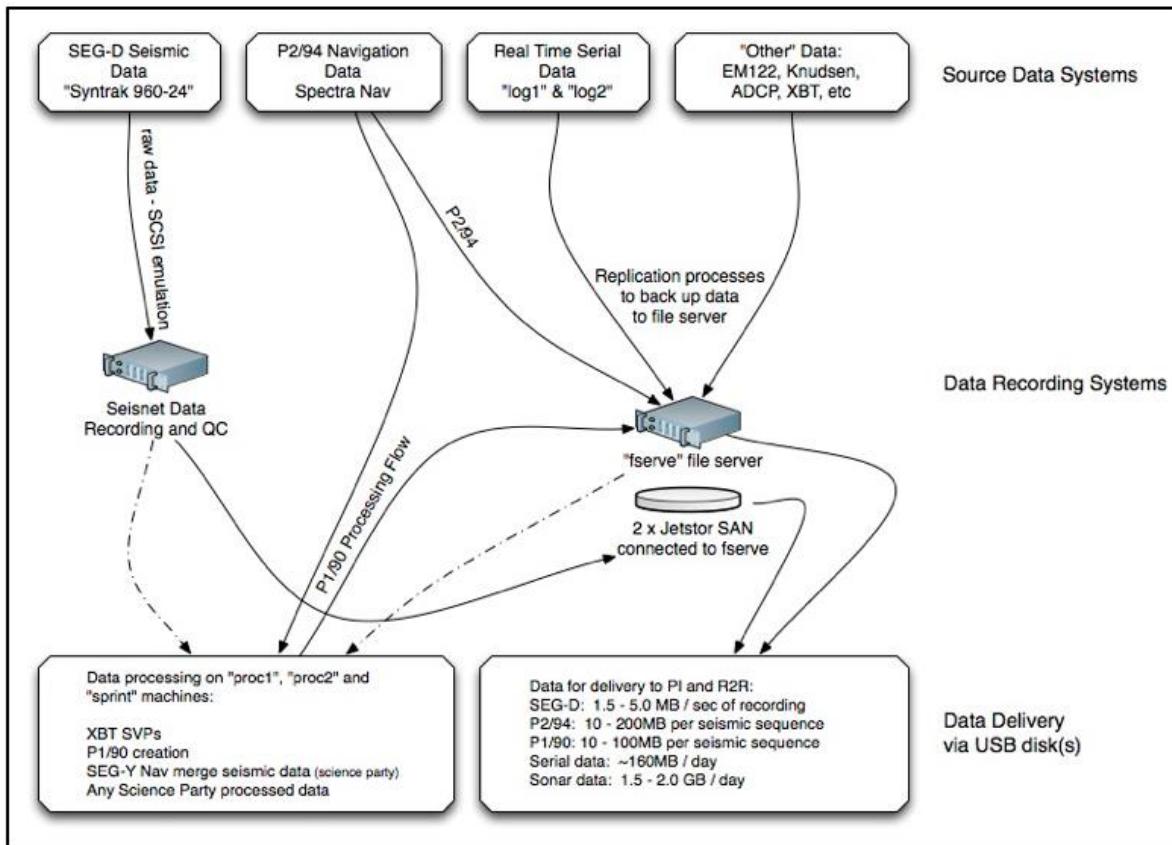

Figure 11. Schematic of the shipboard data acquisition and integration system.

All raw MCS data will be archived at the LDEO Academic Seismic Portal (ASP) along with this report and all additional metadata on the navigation, streamer and gun array. Stacked and migrated sections will be archived with the UTIG ASP (<http://www-udc.ig.utexas.edu/sdc/>).

Protected Species Observing and Passive Acoustic Monitoring: Procedures and Observations

The following figure shows the procedure for assessing and determining mitigation for protected species.

Note that there were no airgun shutdowns due to protected species while shooting within the 3D volume. There were detections that did not require shutdowns because they were not required for those species, or the sightings were outside of the exclusion zone. The only shutdowns were while shooting to OBS and land stations during turns.

Appendix C - Recorded shots when the wrong source fired.

There were several instances when the source triggering failed and the incorrect source was fired. These are listed below.

Seq. 24 1284 – shots: 3042, 2587, 2517, 2451
Seq. 25 1100 – shots: 3132
Seq. 26 1292 – shots: 1741, 1662, 1268, 1046, 0930
Seq. 28 1300 – shots: 2030
Seq. 30 1308 – shots: 2154, 2725, 2715, 2265, 2210, 1717, 1715
Seq 31 1012 – shots: 1999
