INSTITUTE FOR GEOPHYSICS

Passion for Geoscience

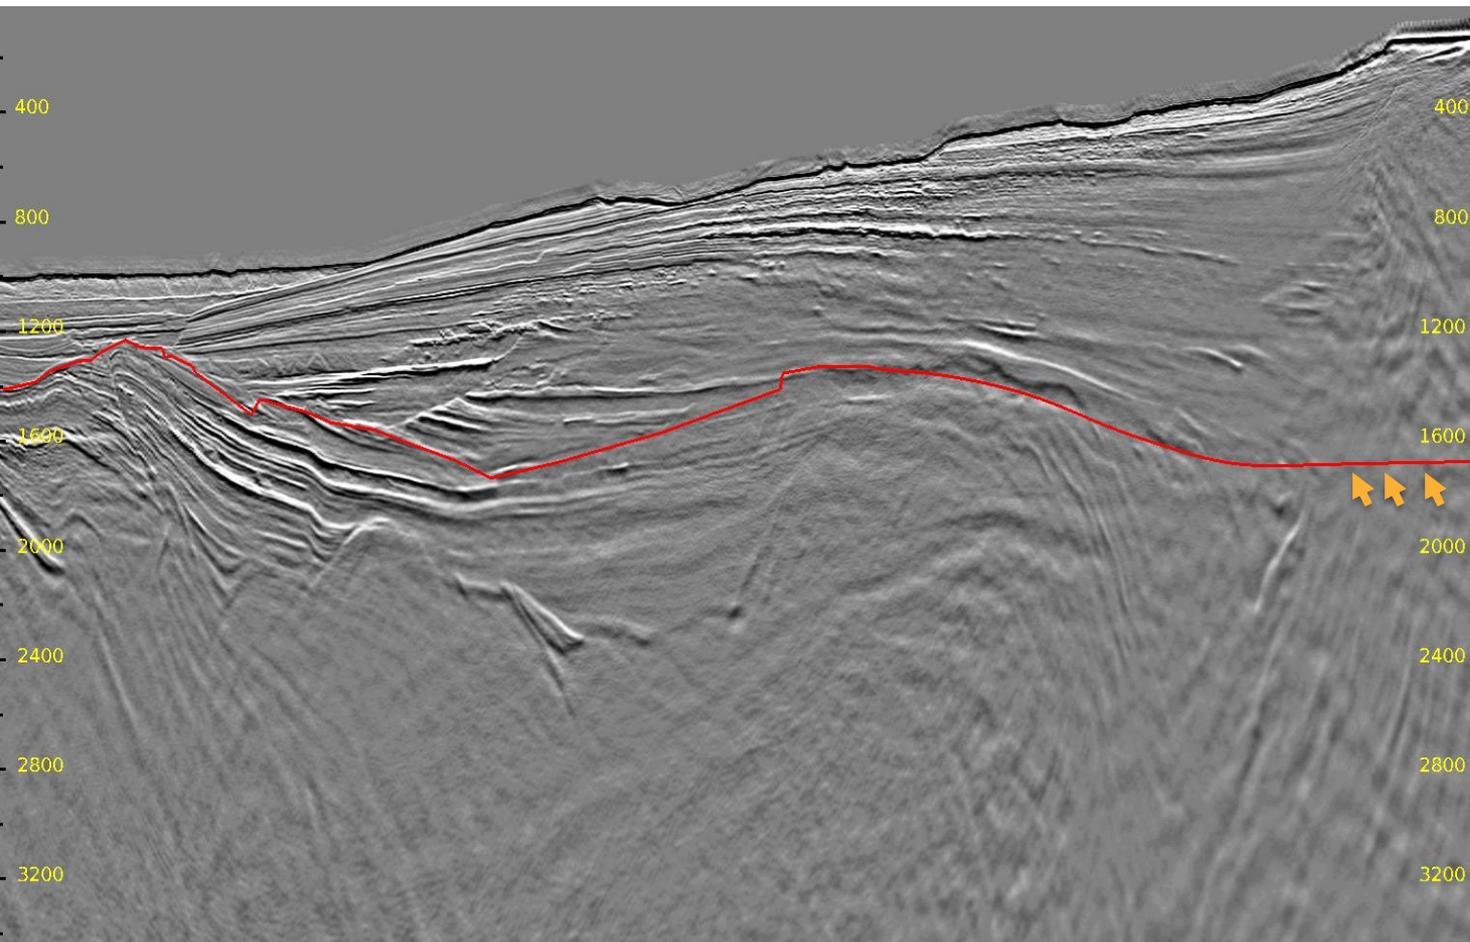

- The unconformity surfaces were load to the system and overlaid on corresponding stack volume.
- In inline direction, the surface matches the volume well, while edge of the survey is not fully covered.
- In crossline direction, sudden jumps between picked inlines are observed.
- Interpolation of the surface was also tested, which does not resolve the jumps in the crossline direction.

# Inline 450: Raw Unconformity Surface

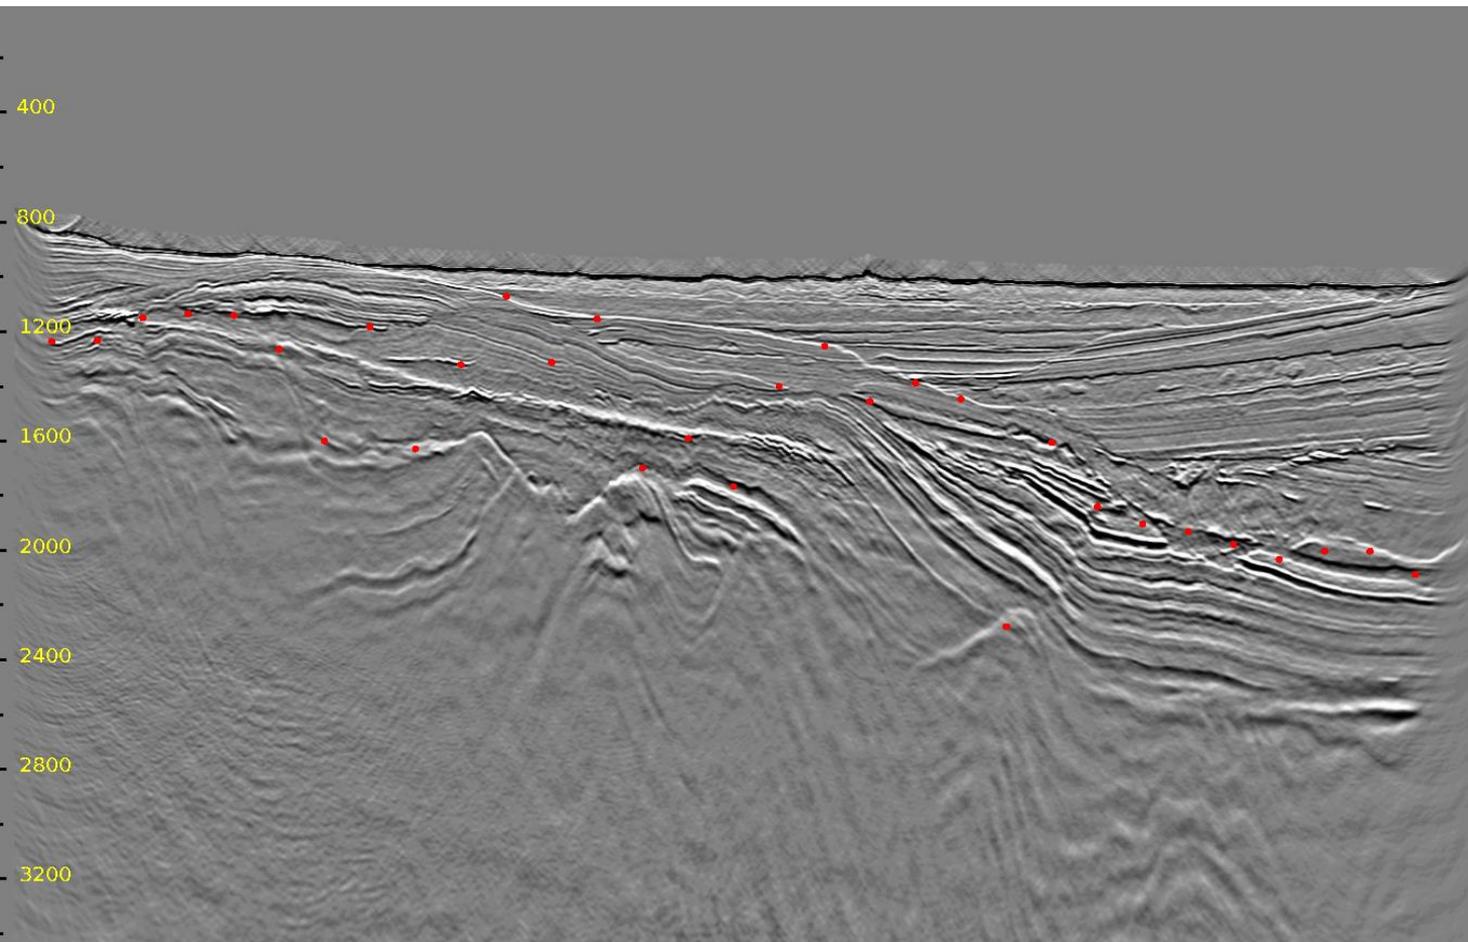

Raw surface without interpolation.

# Inline 450: Interpolated Unconformity Surface

Interpolated surface shows cutting through of events in the shallow water area.

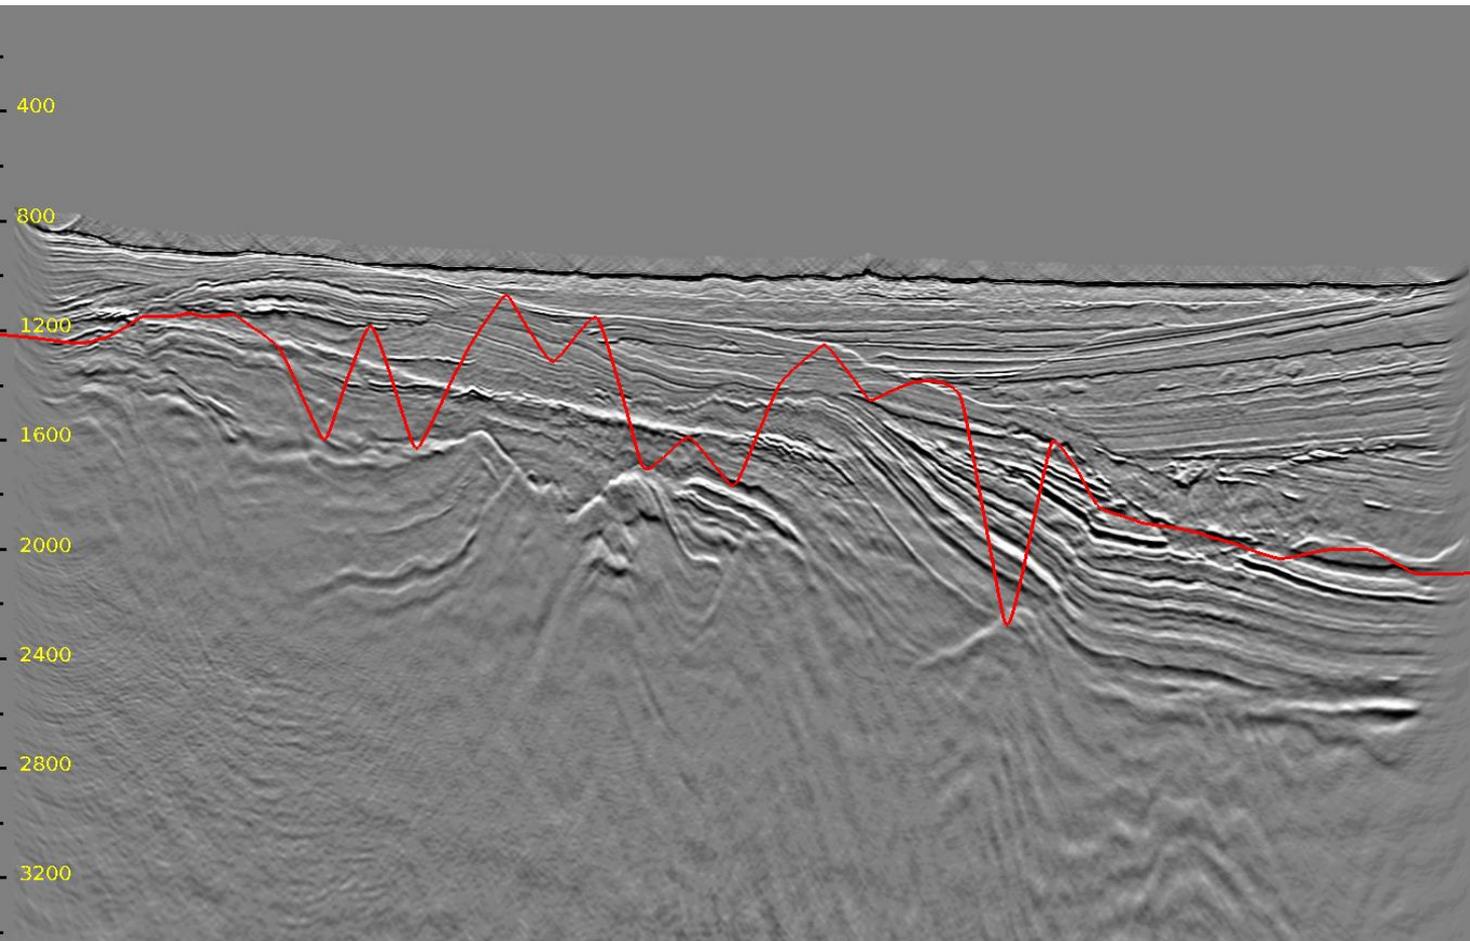

# Crossline 4095: Raw Unconformity Surface

- In the crossline direction, pick inlines seem to jump among different events.

# Crossline 4095: Interpolated Unconformity Surface

- After interpolation, the surface crosses over multiple events.
