INSTITUTE FOR GEOPHYSICS

Passion for Geoscience

- **Objective:**

To further improve deep velocity, especially in the middle and west part.

- **Procedure:**

Following the previous intermediate result, TTI FWI was run to 6Hz. An anomalous inverse Q absorption model was derived from FWI velocity (mainly below the BSR where gas accumulates) and was added to the FWI velocity only inversion. This approach gives a FWI velocity that results in flatter gathers in the gas zone.

- **Display:**

Velocity, migrated depth full stack & gathers.

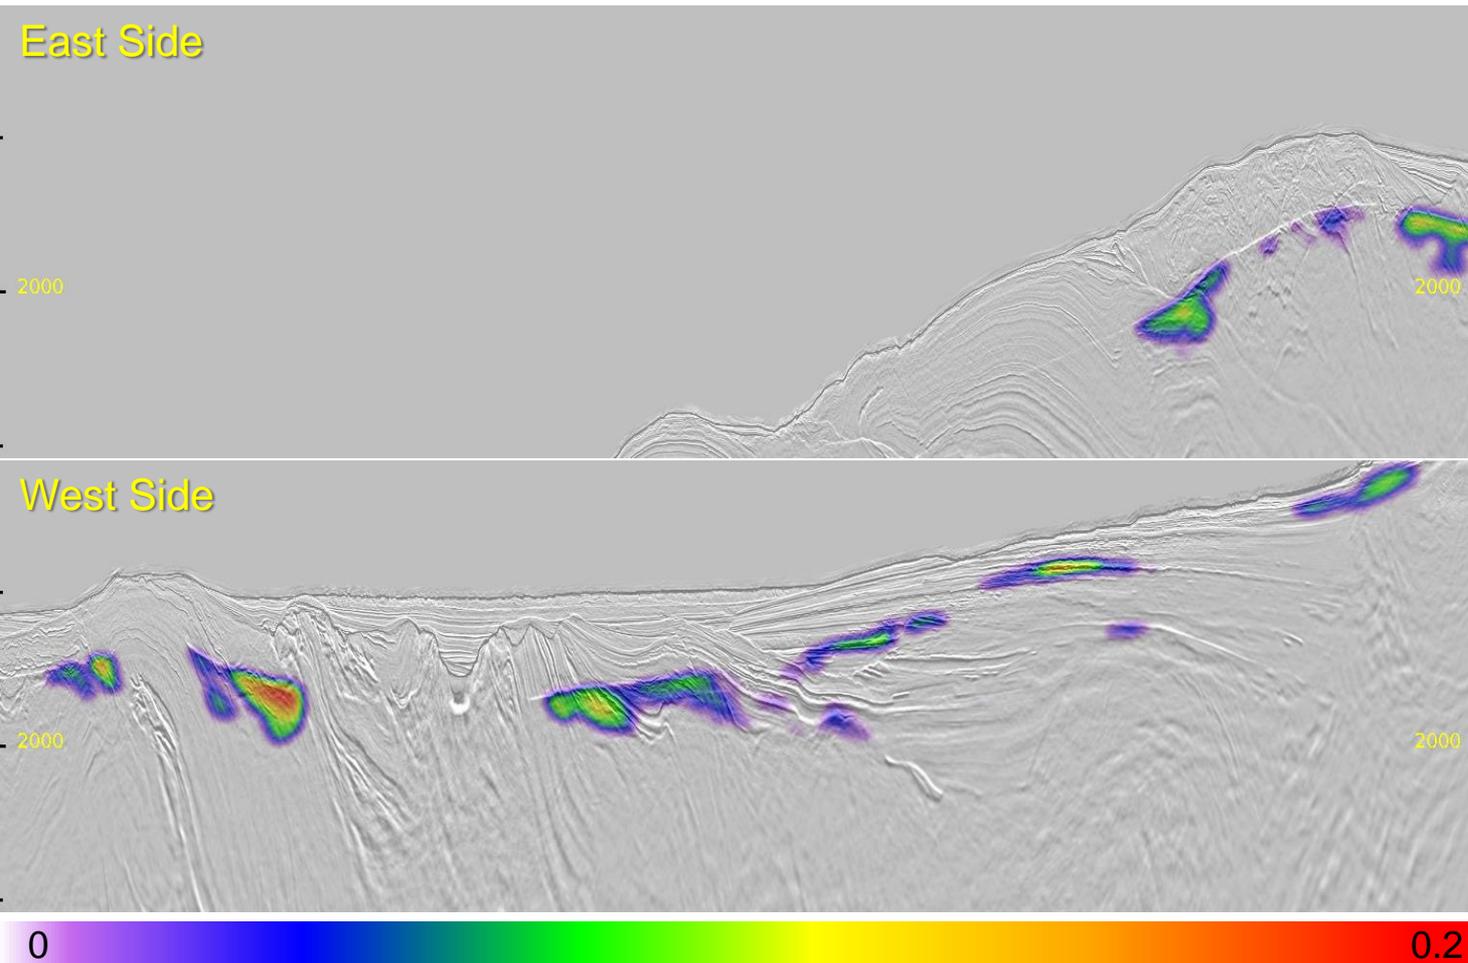

- **Observation and Recommendation:**

In the low S/N area from middle to west of the survey, the velocity in the deeper area is more geological and results in a better imaging of the central dipping events. We'll continue to focus this area for better velocity.

Velocity Model

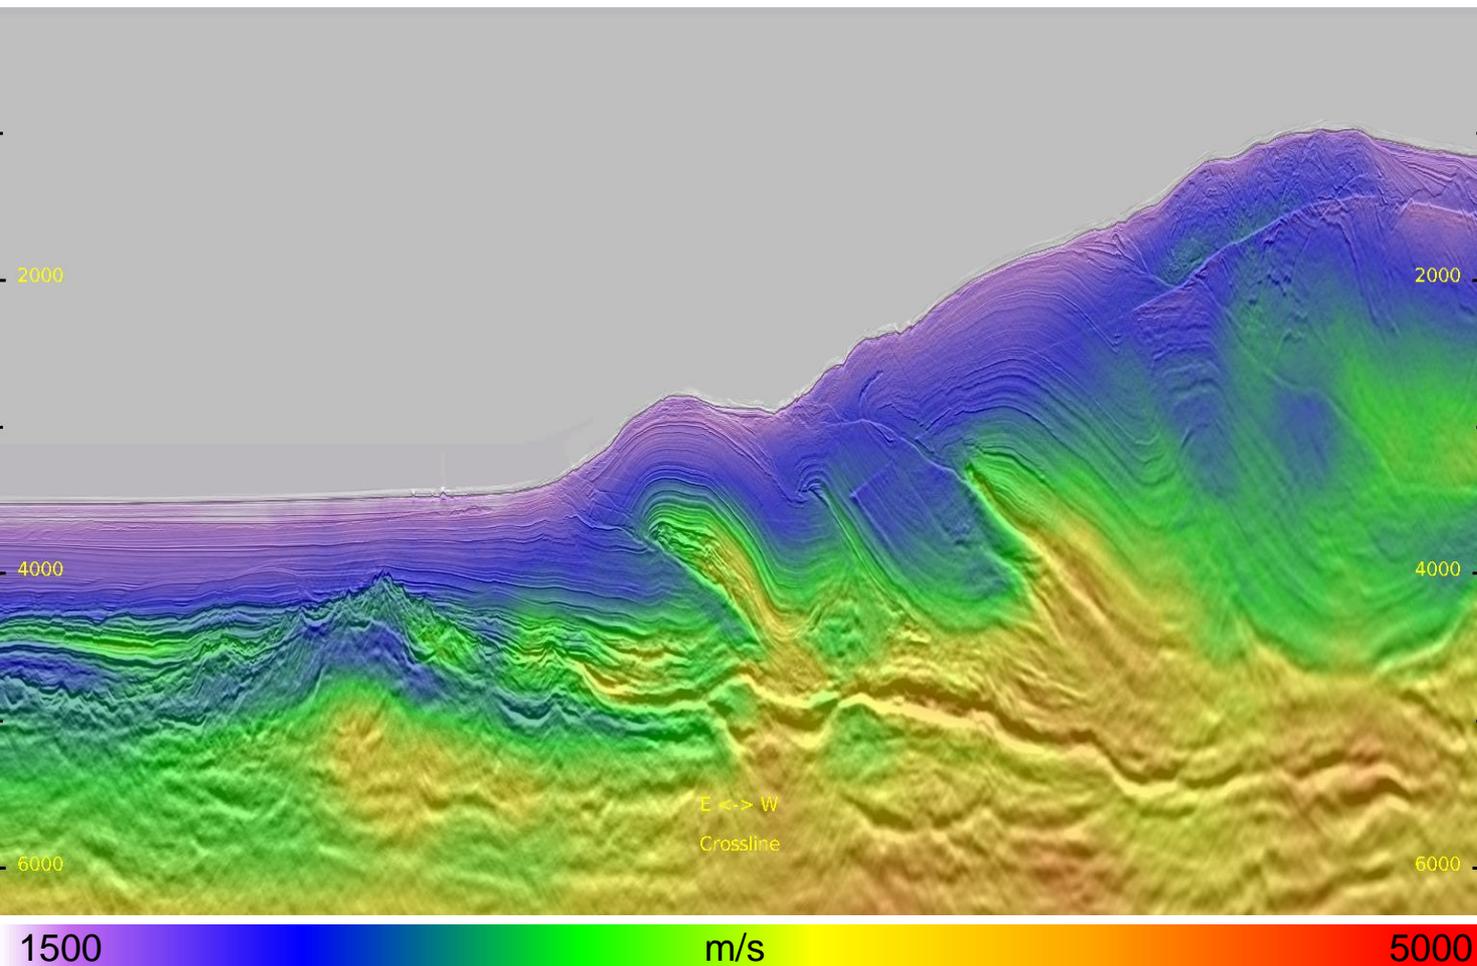

Inline 436: Anomalous Inverse Q Model

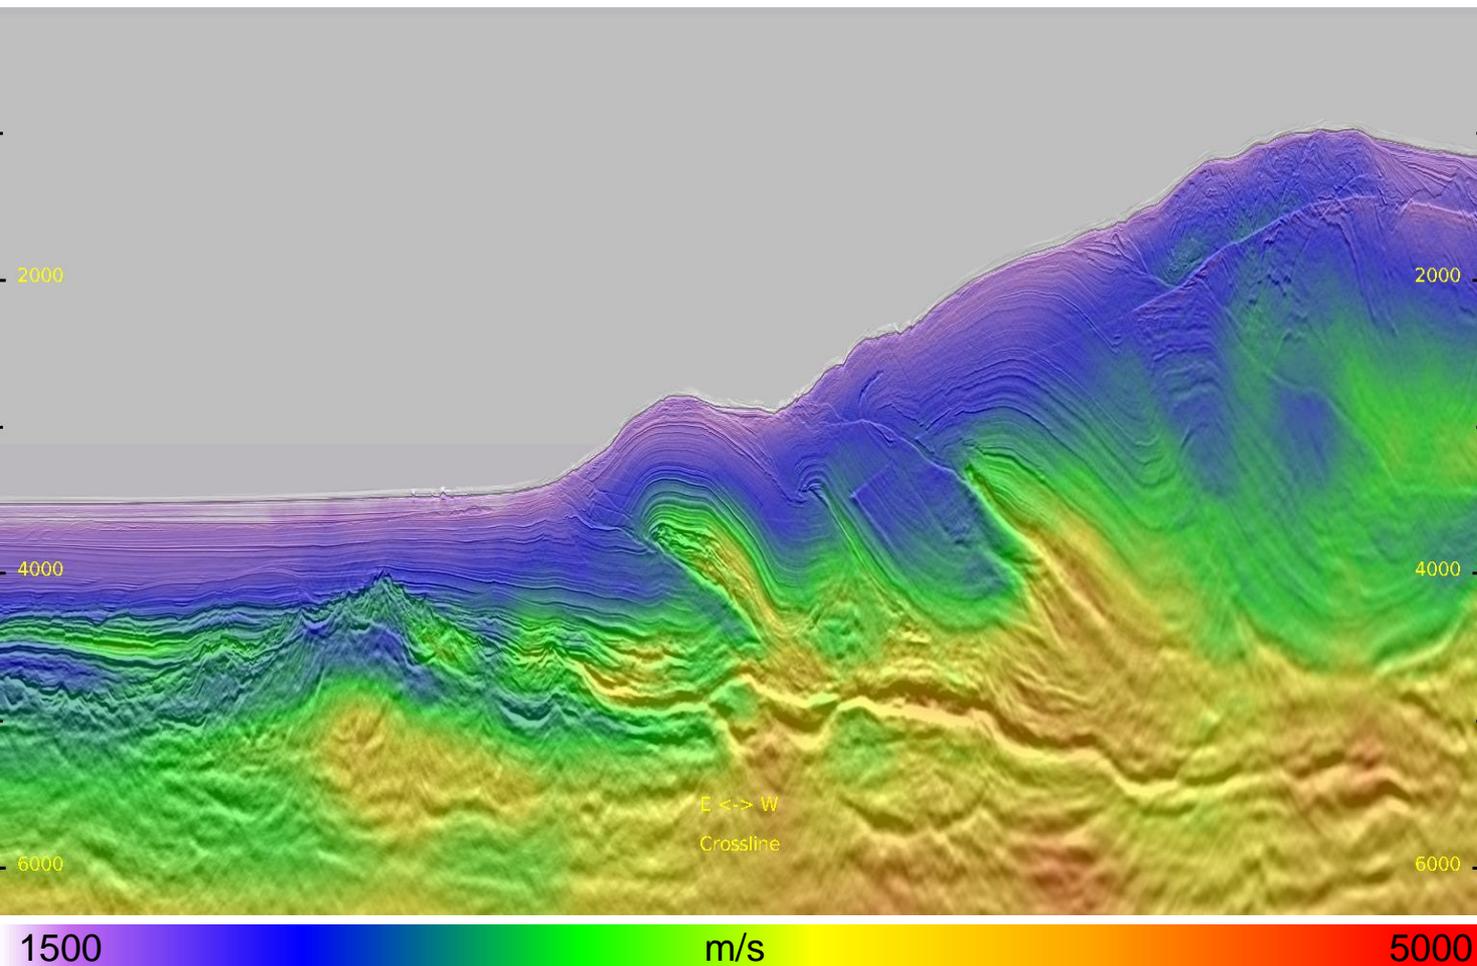

- An anomalous inverse Q Model was derive from the FWI velocity.

Inline 436 Eest: Previous Velocity

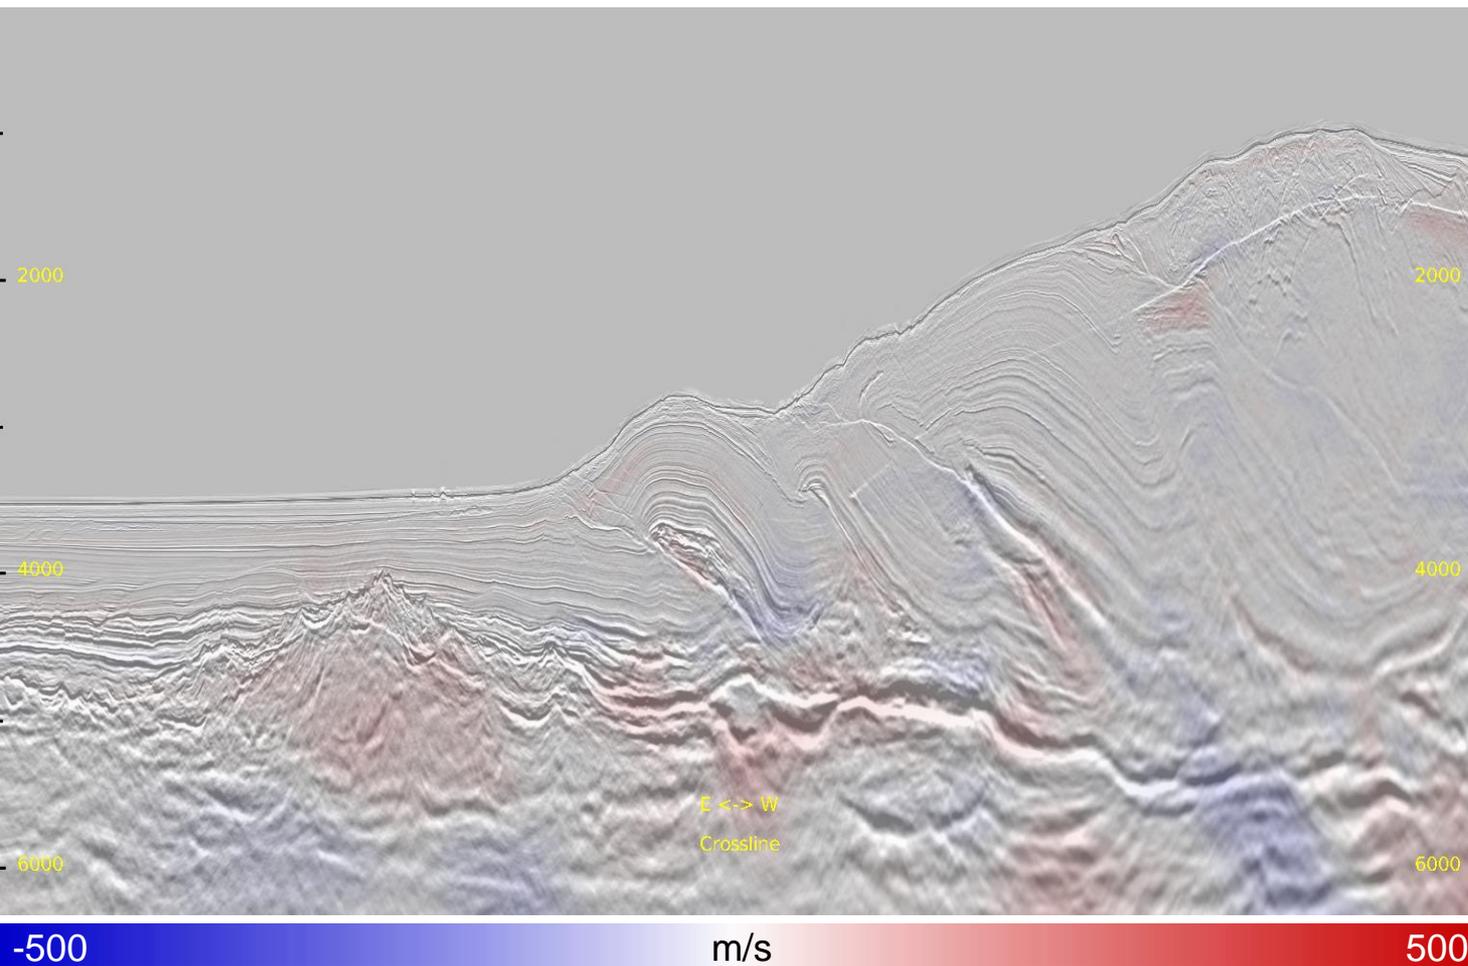

- Previous preliminary FWI velocity

Inline 436 Eest: Current Velocity

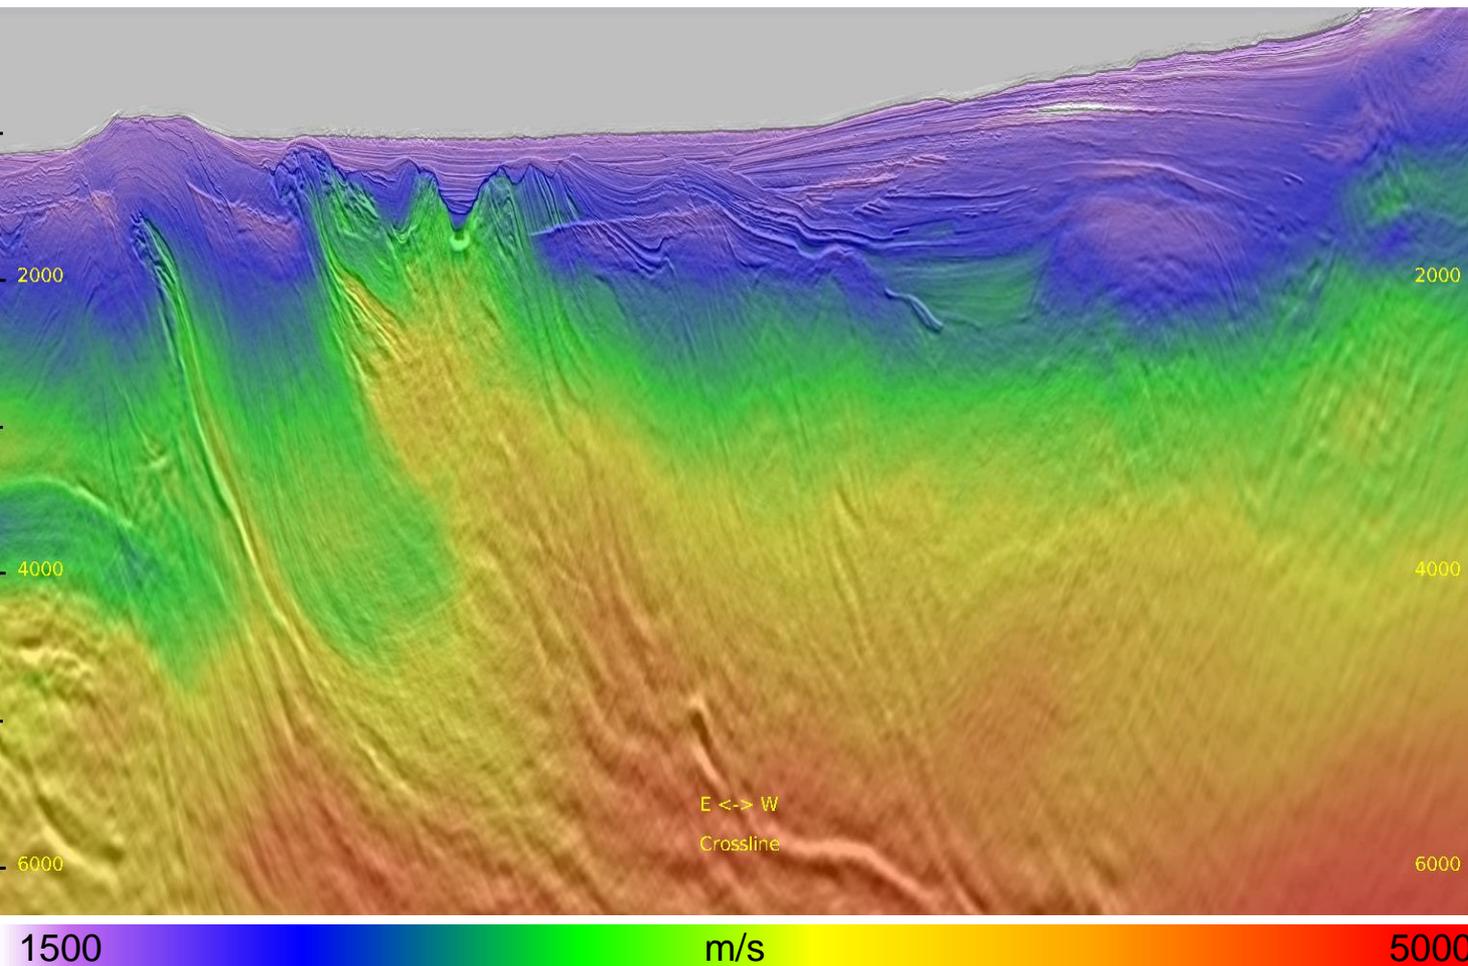

- Current TTI FWI velocity considering anomalous Q absorption.

Inline 436 Eest: Velcoity Perturbation

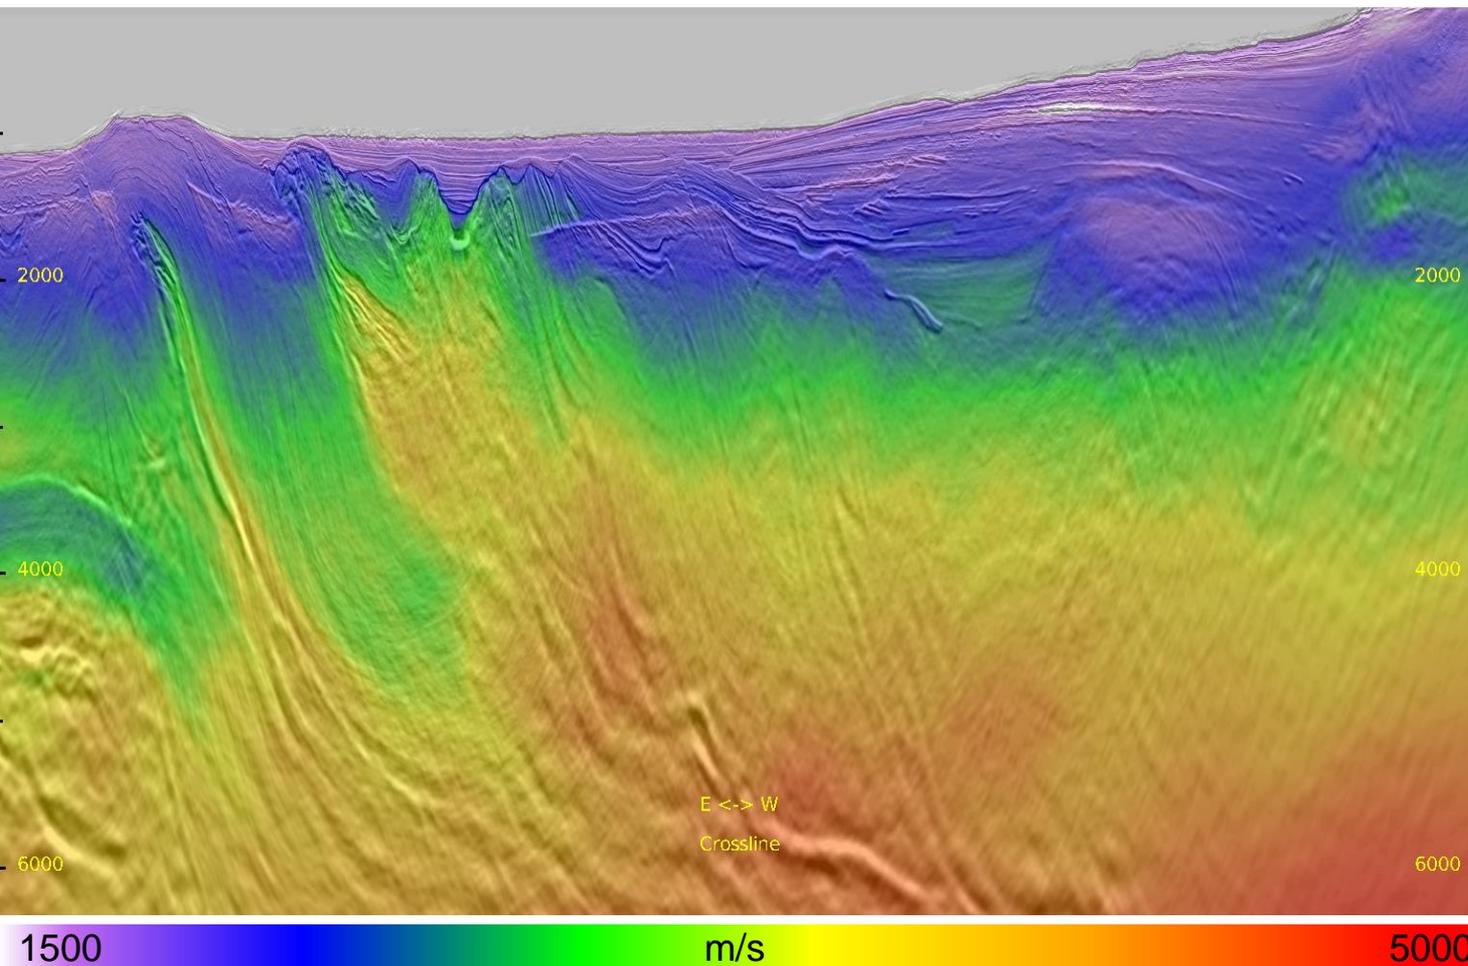

- Velocity perturbation shows a increase of velocity below the BSR.

Inline 436 West: Previous Velocity

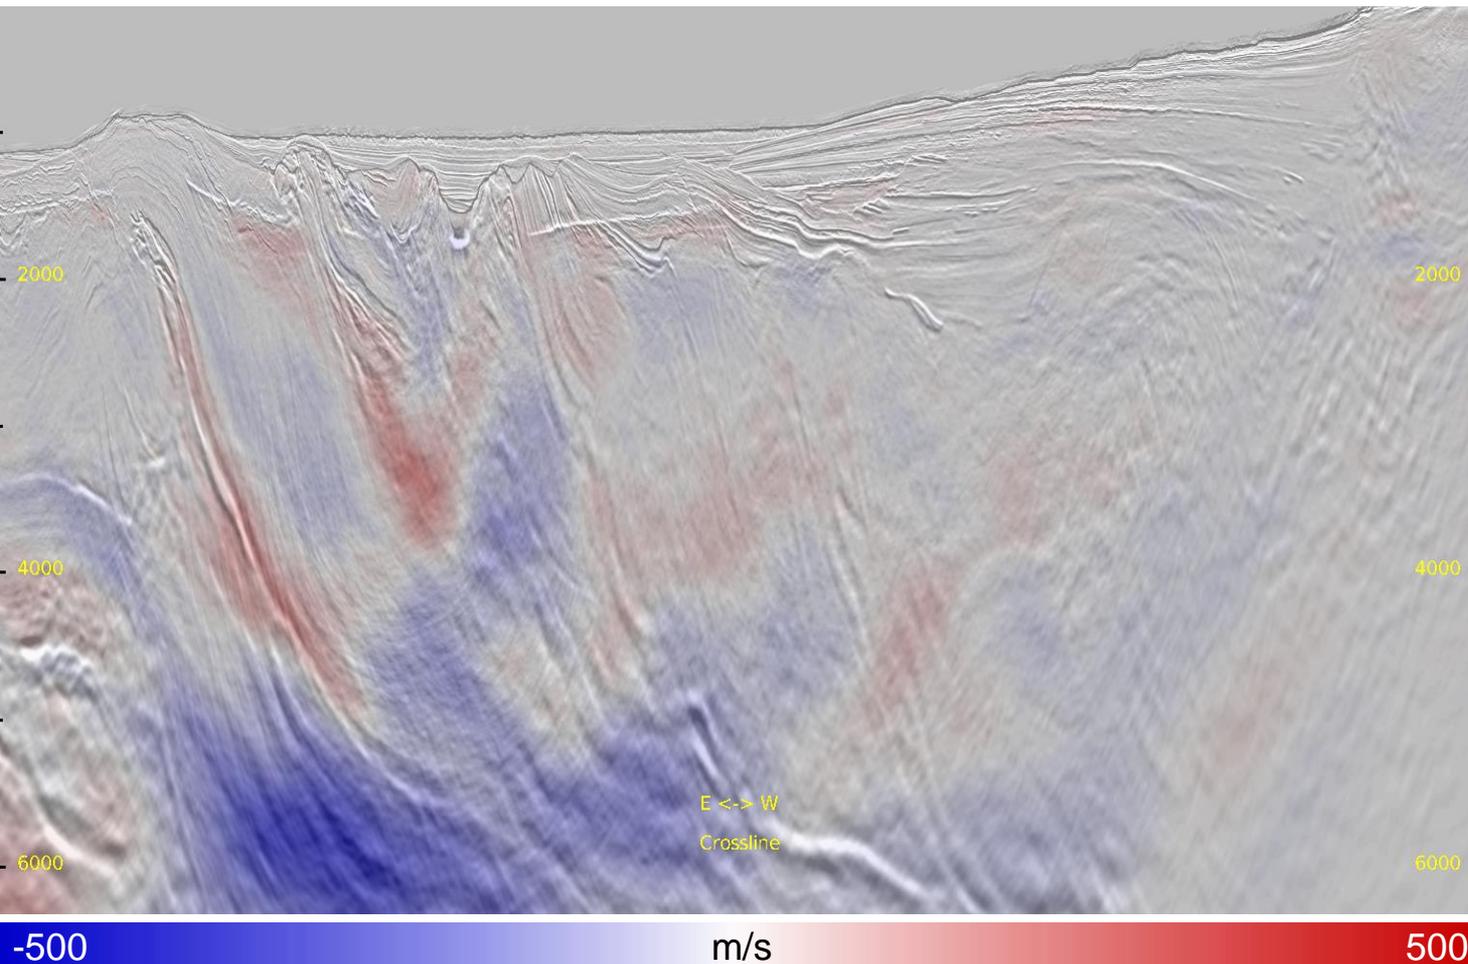

- Previous preliminary FWI velocity

Inline 436 West: Current Velocity

- Current TTI FWI velocity considering anomalous Q effect.

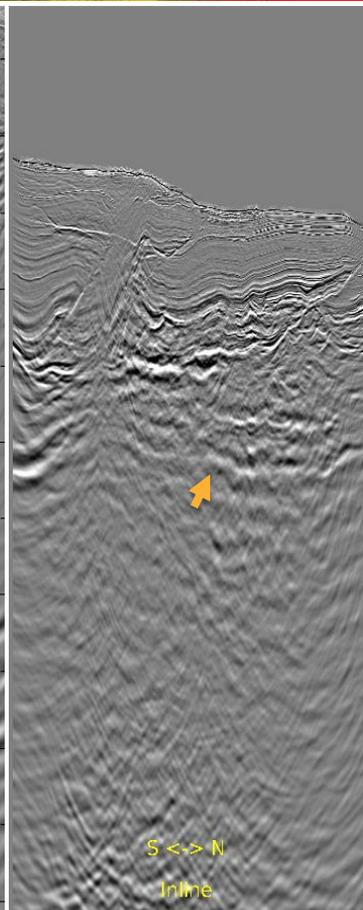

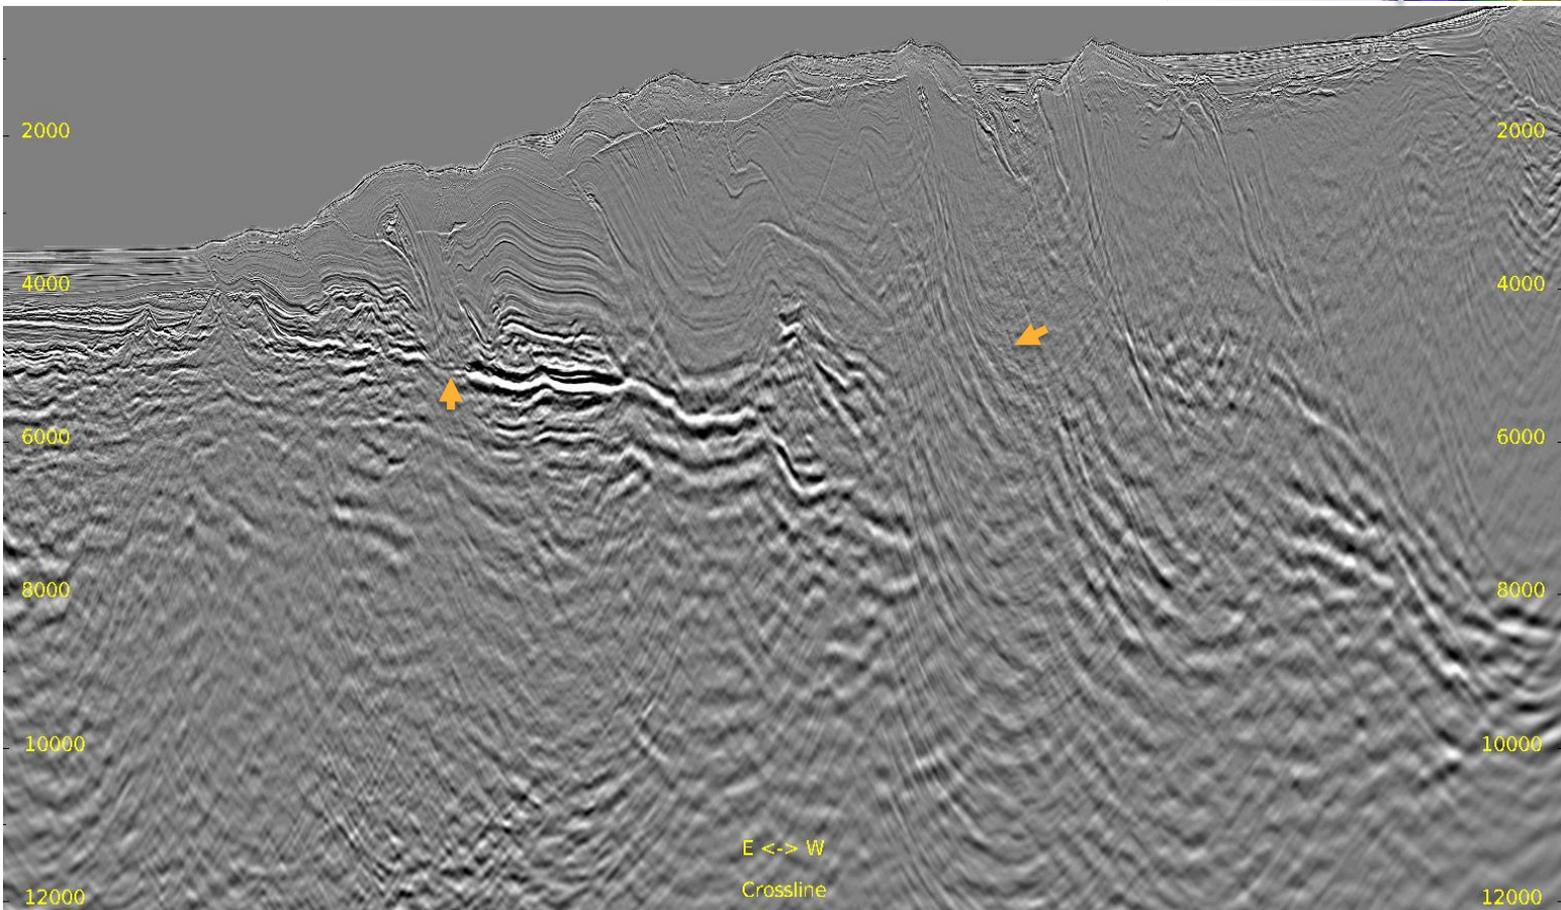

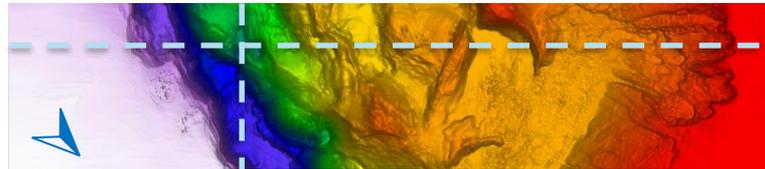

- Velocity perturbation shows a increase of velocity below the BSR and in the gas zone.
